IBEC ANNUAL REPORT

2011

Introduction

“ I truly believe the support structure at IBEC is probably the best in the whole Catalan research system, and possibly even in the Spanish one.”
– Josep A. Planell

The high point of 2011 at IBEC was our tremendous success in the Ministry of Science and Innovation's 'Apoyo a Centros y Unidades de Excelencia Severo Ochoa' programme, which stood testament to the strength of our institutional strategy even in the face of financially difficult times.

Aiming to identify the best research centres in the country according to scientific relevance, human resources and international competitiveness, the programme selected IBEC among the 22 centres to go through to the second round, out of a total 75 in a wide range of disciplines. This not only ranks IBEC among the 22 best evaluated research institutes in Spain, but also placed us within the top ten of the centres working in physics and engineering.

Another coup was the result of the year's International Scientific Committee meeting. Favourably impressed by their evaluations of the latest four groups to be examined, and finding their positive opinion of the overall quality of our work and strategy reinforced, the committee announced its intention to include in its final report a recommendation to the Board of Trustees to seek ways of improving our funding.

These successes were undoubtedly a direct result of the quality of research that our group leaders and their respective groups are conducting. IBEC is attaining real scientific excellence that places us amongst the best in Spain, and allows us to compete at a European and international level. However, it is also thanks to our tremendous support structure. The support services staff – in finance, HR, general and institutional projects, funding services, infrastructures, events, and communications – are not only experts, but they're totally committed to the mission and the goals of IBEC. They allow our excellent researchers to concentrate on their work, making everything else in life simpler and providing the best possible conditions for 220 scientists to achieve results that are at the frontier of knowledge. I'm tremendously proud of them, and personally believe that the support structure at IBEC is probably the best in the whole Catalan research system, and possibly even the Spanish one.

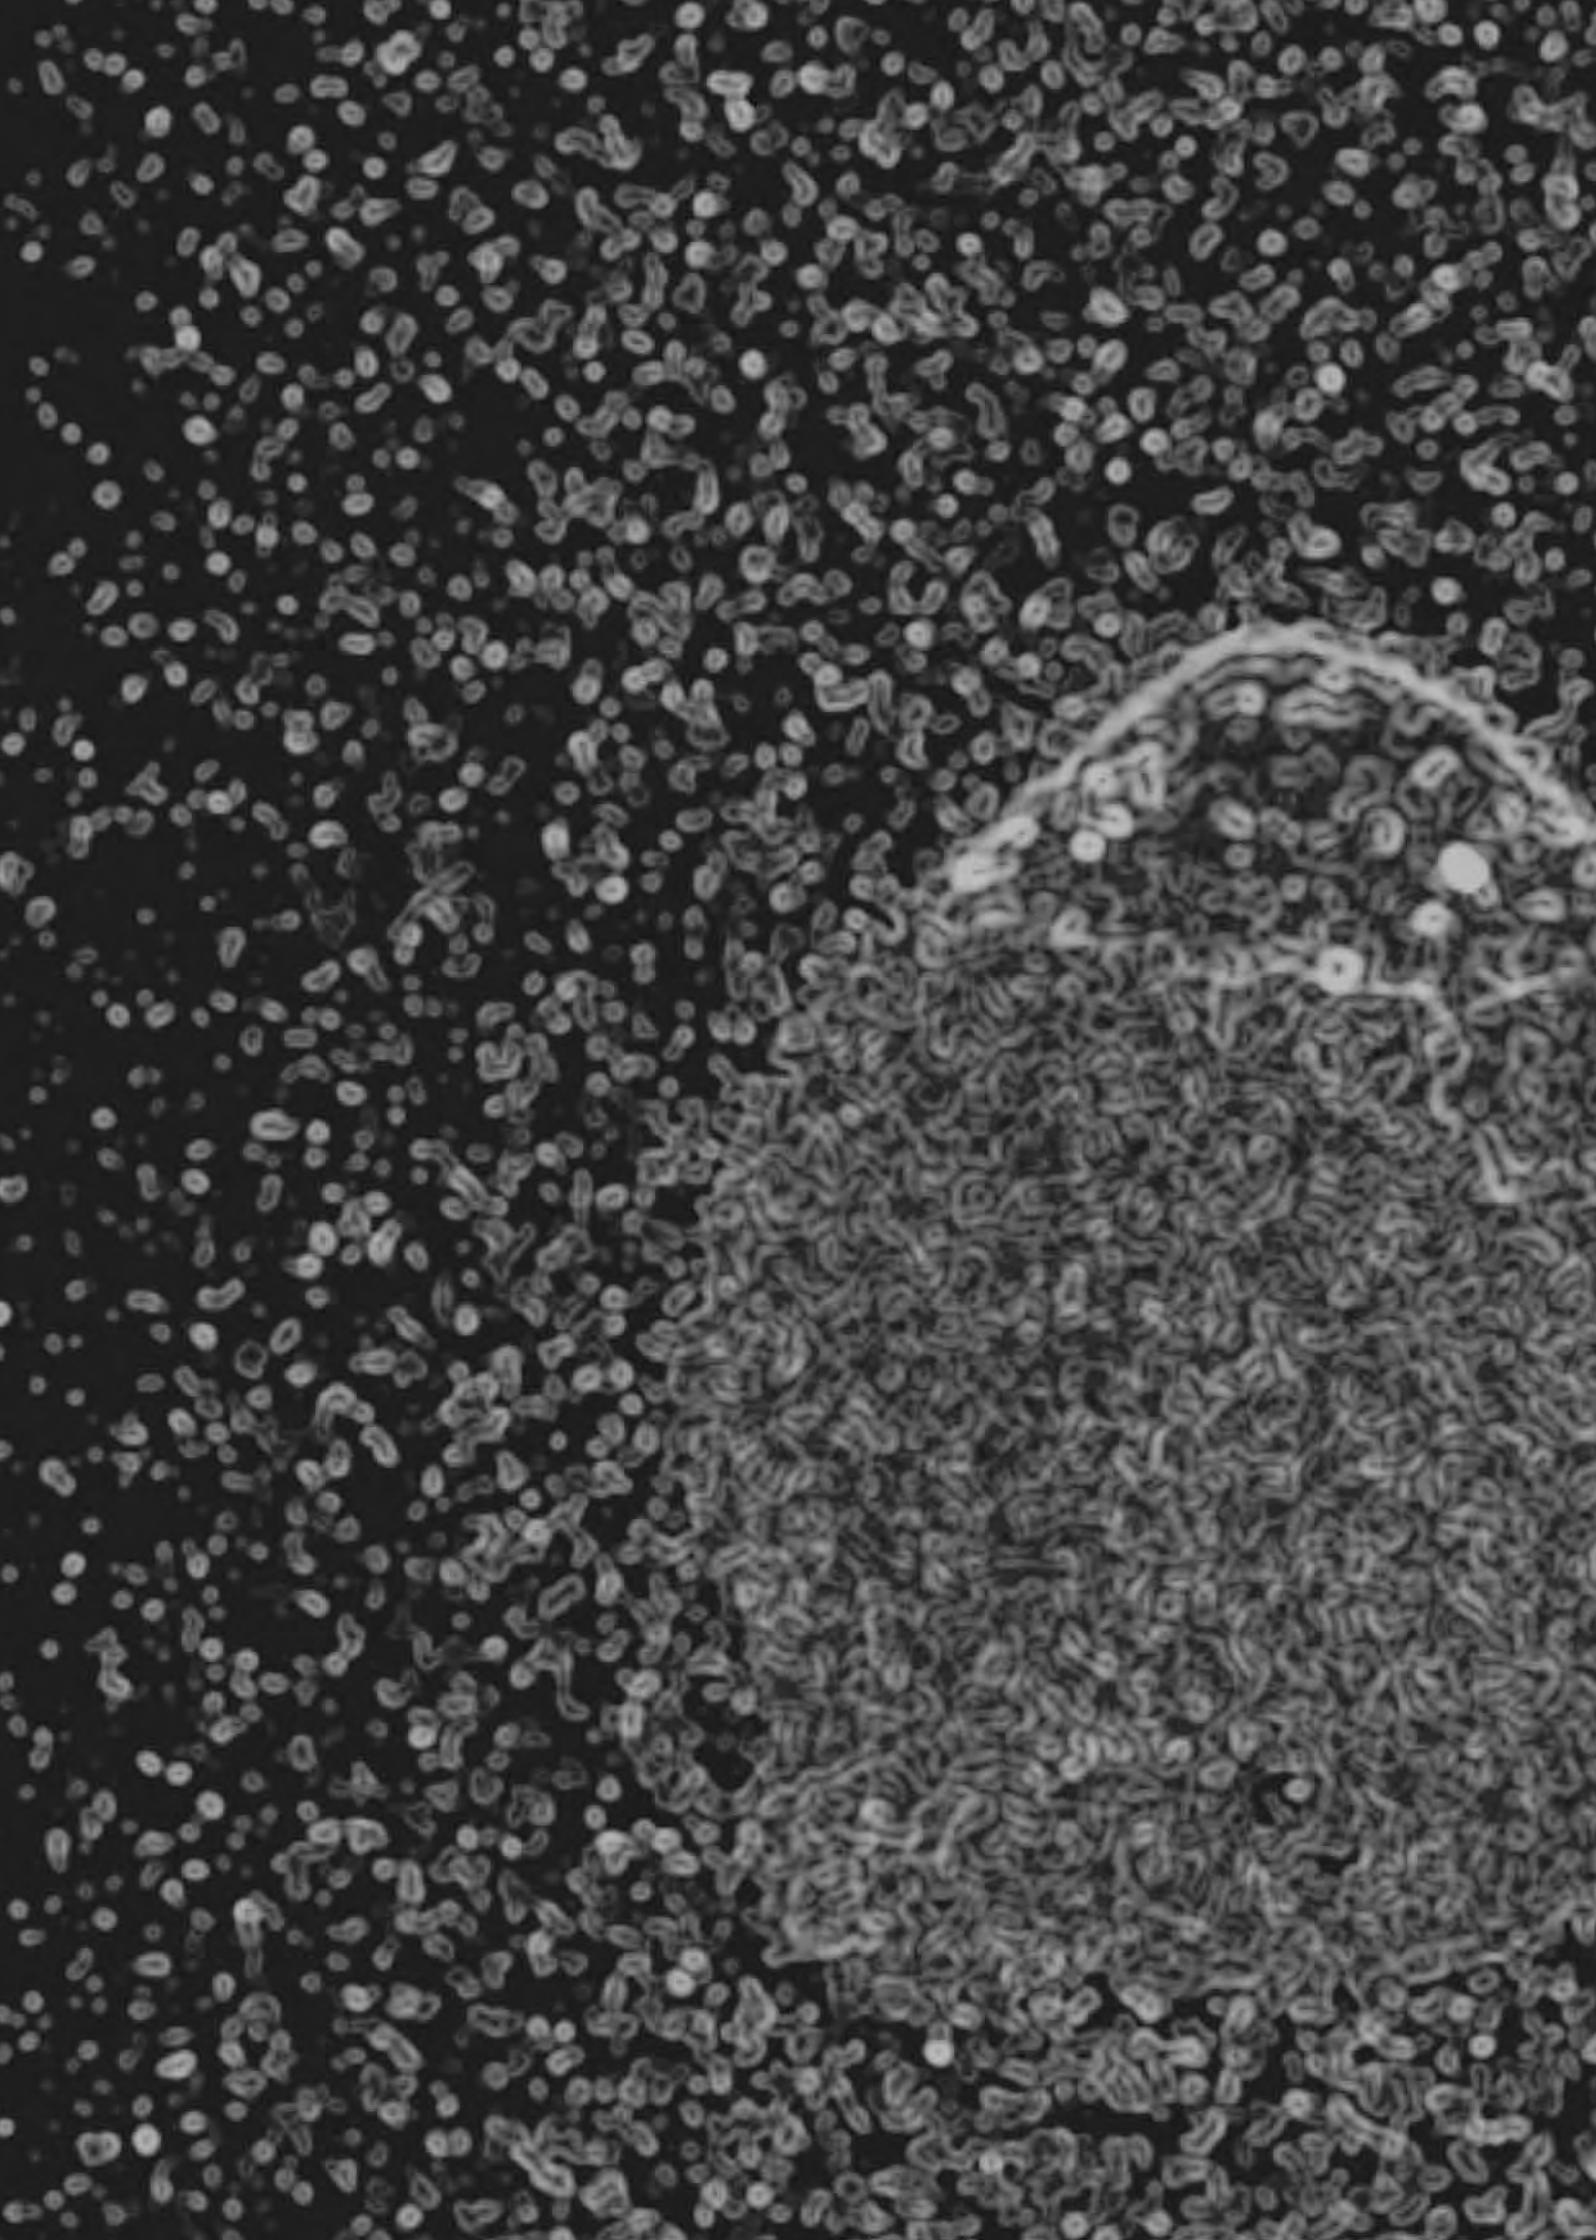

It was a year of change at various levels, with the departure of managing director Abel Riera and the arrival of his replacement, Alex de Jaureguizar. Despite the upheaval that change at the top inevitably brings, the support services team continued to work at full capacity in the face of new challenges and with unfailing loyalty to the institute. On the scientific side, we also saw Single Molecule Bionanophotonics group leader Maria Garcia-Parajo depart the institute for the more physics-based environment of ICFO, the bioengineering facet of her research having been fruitfully completed in the five years she spent at IBEC.

The current financial climate dictates that when good researchers leave, they cannot be immediately replaced, but our aim is to protect our present level of resources and capacity of work. To this end, in 2012 we will set in motion a procedure of tenure track to ensure reasonable growth by attracting outstanding young researchers to the institute, as well as leveraging the promising talent we already have. With these efforts, I believe we can expect that by 2015 our position will be extremely strong, allowing us to speed up to pole position towards the definitive growth and consolidation of IBEC.

The associate director and I are proud of all IBEC's researchers and staff, and it is a great honour and pleasure to be able to work with all of them. We'll make through the difficult times together with effort, cooperation and a lot of enthusiasm.

Josep A. Planell
Director of IBEC

News highlights

January

IBEC researcher receives Pablo Motos award

Eduard Torrents, senior researcher in IBEC's Microbial Biotechnology and Host-pathogen Interaction group, was announced as a recipient of the 2010 Pablo Motos award from the Federación Española de Fibrosis Quística (Spanish Association of Cystic Fibrosis) at the beginning of the year. Pablo Motos, a well-known TV personality and creator of the popular show 'El Hormiguero', donates the royalties from his book 'Frases célebres de niños' to the foundation to provide the annual prize, which aims to support research projects in cystic fibrosis or social initiatives that benefit sufferers of the disease.

Eduard's project, 'Ribonucleotide reductase: a novel therapeutic target against bacterial pathogens in cystic fibrosis patients' was one of a total of four winners chosen by the foundation from many proposals entered from all over the country. A quarter of the total prize amount will fund his work on the project for up to two years.

Kick-off meeting of the Connect-EU Nanobio+ Nanomed working group

January saw the kick-off meeting at IBEC of the Connect-EU Nanobio+Nanomed Working Group (WG). An initiative that aims to promote and reinforce Catalan participation in the EU's instruments for research funding such as FP7 and its successor, HORIZON 2020, the Connect-EU network of WGs covers a range of sectors, from the internet of the future to food technology and processing.

IBEC leads the Nanobio+Nanomed WG, which also involves as core members other centres such as ICFO, ICN, IQAC-CSIC and ICMAB-CSIC; companies from the biotech, pharma and medtech sectors, such as Advancell and NTE-Sener; and hospitals, led by Vall d'Hebron. The WG membership reflects the multidisciplinary of

nanobiotechnologies and its many possible applications at industry level.

During the meeting, the group discussed the first steps towards its aim to provide an expert opinion on the 'hot' topics and the local strengths in the field for ACCIÓ, the agency set up by the government to make Catalan enterprise more globally competitive.

February

Nanomedicine in Spain: looking back to see forward

A 'who's who' of Spain's major players in nanomedicine and a record of this new field's most notable achievements, "Nanomedicine in Spain 06-10", was launched in February.

The report, which was coordinated by IBEC as leader of the Spanish Nanomedicine Platform (NanoMed Spain), covers the creation of large research initiatives such as CIBER-BBN, public-private collaboration, international consortia such as BOND and Lymphotarg and entrepreneurship activities fostered by the Platform. As a reference work for this emerging area, it aims to provide an overview of nanomedicine's formative years for policy makers, industry associates and existing stakeholders, as well as those looking to enter the field.

The document was presented at the one-day workshop 'Nanomedicine in Spain: present and future' at the the Center for Industrial Technological Development (CDTI) in Madrid, chaired by M^a Luisa Castaño, Deputy Director General of Strategic Public-Private Cooperation (MICINN). The workshop also featured presentations by some top researchers in nanomedicine to foster an open debate on Spain's strengths in this emerging sector and the key technologies to focus on in the next few years.

Think Lab

In February IBEC joined forces with Barcelona's Arts Santa Monica centre and the British Council for a special activity

Meeting of the Connect-EU working group; Funding from RecerCaixa for photopharmacology project; Public presentation of BioNanoMed Catalunya

looking at the research laboratory from a cultural point of view.

Within the framework of the centre's 'Think Art, Act Science' exhibition, 'Think Lab' comprised two workshops, a round table debate and a performance. All took a look at the lab as a cultural phenomenon, concluding that as a place for experimentation, for trial-and-error hypothesizing, for creating knowledge through experience and for opening the door to future innovation, a multidisciplinary and international scientific laboratory has a spirit and a dynamic that shares much with culture as a whole.

Later in the year this arts and science initiative was awarded the Antoni Caparros Prize for Best Knowledge Transfer from the University of Barcelona.

Funding from RecerCaixa for photopharmacology project

ICREA group leader Pau Gorostiza's project 'Development of light-modulated ligands for remote, non-invasive regulation of neuropathic pain' was announced as one of the first twenty projects to be chosen for funding by a brand new programme, RecerCaixa.

A joint initiative by the Associació Catalana d'Universitats Públiques (ACUP) and Obra Social la Caixa, RecerCaixa has earmarked €9m for the period 2010-2014 to finance research projects selected for their scientific quality. The first twenty, which were chosen from 461 hopefuls, focus on health sciences, particularly public health, and social sciences to do with education and immigration.

Pau's project goes deep into the new pharmacological concept of light-controlled drugs (photopharmacology), including how to regulate their effectiveness and the spatial and temporal distribution of their physiological effects. It's hoped that the results of this study will be relevant to personalised medicine and the development of patient-specific therapies.

This was the second major project involving Pau who, alongside Fausto Sanz, heads IBEC's Nanoprobes and Nanoswitches group. In January the collaborative project Single Molecule Activation and Computing (FOCUS), in which he is a partner, was awarded funding by the EU for its work on

building a next generation of biologically inspired molecular devices based on new photonic tools.

May

Public presentation of BioNanoMed Catalunya

A press conference to present BioNanoMed Catalunya, the IBEC-led alliance created to promote nanotechnology applied to healthcare and biotechnology, was held in May at the Museu Colet in Barcelona.

BioNanoMed Catalunya brings together 18 research centres, hospitals and companies to share know-how and resources, facilitate new developments in nanomedicine and gain international visibility for the advances in nanotechnology that are emerging in Catalonia. Along with Biocat, the Catalan Bioregion agency, IBEC has been developing the initiative since 2009. Among the 37 research groups involved in the alliance are IBEC's Bio/Non-bio Interactions for Regenerative Medicine, Cellular Biomechanics, Nanobioengineering, and Nanoprobes and Nanoswitches groups.

The network's first public activities included a presentation at the EuroNanoForum at the end of May in Budapest and participation in Washington's BIO Convention in June.

ERC Starting Grant for IBEC researcher

Biomechanics and mechanobiology group leader Damien Lacroix was awarded a prestigious European Research Council (ERC) Starting Grant for his research on finite element simulations of mechanobiology in tissue engineering.

With the funding, which will be supplied for up to five years, Damien will attempt to reach new frontiers in mechanobiology with the development of a novel approach for the modelling of tissue engineering. By integrating the microscopic modelling of cells with the macroscopic modelling of scaffolds, this research will shed light on the influence of

News highlights *continued*

mechanical loading and stimuli on cell behaviour and the subsequent formation of tissues.

Damien is the third IBEC researcher to win one of these highly sought-after grants, about 250 of which are awarded each year to EU-based researchers with talent and proven potential. In the last call, nearly 4100 proposals were submitted. In 2008 Pau Gorostiza, group leader in IBEC's Nanoprobes and Nanoswitches group, received an ERC Starting Grant, as did Xavier Trepas in 2009.

July

IBEC passes the first stage of Severo Ochoa

IBEC was one of 22 centres, covering a wide range of disciplines, out of a total of 75 to be selected to go through to the second stage of the Ministry of Science and Innovation's 'Apoyo a Centros y Unidades de Excelencia Severo Ochoa' programme.

The programme, which was launched by the MICINN in April, aimed to identify the ten best research centres in the country according to scientific relevance, human resources and its international competitiveness. Successful centres, which are selected by a committee of international investigators and Nobel Prize winners, receive a million euros annually for four years, preferential access to scientific installations and flexibility in the contracting of researchers.

October

'Roadmap' for nanobiotech in Catalonia presented

The IBEC-coordinated Connect-EU Nanobio + Nanomed working group published a 'roadmap' for nanobiotechnol-

ogy capabilities in Catalonia, the first major step since the group's launch at the end of last year.

The document, "Connect-EU Nanobio + Nanomed Strategic Research Agenda" was presented at the annual forum of the European Platform on Nanomedicine (ETPN), which followed the 4th IBEC Symposium at the Hospital de Bellvitge. As well as providing a plan for this strategic area of knowledge in the region, the publication aims to help define priorities in innovative applications for the pharmaceutical, medtech and environmental industries that can be transformed into European projects under the EU's FP7 funding programme and its continuation, HORIZON 2020.

November

IBEC students' PhD programmes get top billing

The Spanish Ministry of Education published the list of doctoral programmes that have received the accreditation of "Mention of Excellence". Among them were all the main doctoral programmes open to IBEC PhD students from the University of Barcelona (UB) and the Universitat Politècnica de Catalunya BarcelonaTech (UPC).

Programmes receiving this quality award have achieved the highest marks in a rigorous selection process, and are recognised as international benchmarks in their fields. Criteria taken into account in order to achieve this ranking include publication records, the programme's ability to attract students from other universities and nationalities, possibilities for mobility and placements abroad, and participation in competitive research.

The awarded programmes included Biomedicine, Biotechnology, Nanoscience and Nanotechnology, and Engineering and Advanced Technologies (UB), and Biomedical Engineering, Materials Science and Engineering, and Automatic Control, Robotics and Computer Vision (UPC).

La Marató de TV3 2010 funds awarded

The 55 researchers who received funding from fundraising programme La Marató de TV3 2010, including IBEC's Pau Gorostiza, attended a ceremony at the UAB where the grants were awarded in the presence of Minister of Health Boi Ruiz, Rector of the UAB Ana Ripoll, and La Marató de TV3 founder Enrique Marin.

Pau's project with Dr. Artur Llobet Berenguer of IDIBELL, "Regeneració de circuits neuronals mitjançant marcapassos optogenètics", receives almost €300,000 of the €7.7m total raised by the 2010 edition of the fundraising show. It will set the basis of a novel pharmacological approach to neuronal regeneration by defining a proof-of-principle based on optogenetics and photopharmacology.

December

Funding success for two IBEC projects

Towards the end of the year, two IBEC-led tissue regeneration projects were selected for funding by the EU's ERA-NET EuroNanoMed initiative.

'Angiogenic nanostructured materials for non-consolidating bone fractures' (nAngioFrac), coordinated by Josep Planell's Bio/non-bio Interactions for Regenerative Medicine group, brings together four other academic, clinical and industrial partners from France and Poland. It aims to develop tailored biodegradable and bioactive nanostructured scaffolds to ensure the correct release of calcium, a major player in angiogenesis (the formation of new blood vessels), to promote tissue repair in pseudarthrosis. This condition results from inadequate healing after a bone fracture and sometimes during development, and results in a 'false joint'.

The second project, 'Nanostructured Gel for Cellular Therapy

of Degenerative Skeletal Disorders' (STRUCTGEL), will be coordinated by Molecular Dynamics at Cell-biomaterial Interface group leader George Altankov and involves partners from Germany, France and Turkey. With the aim of tackling degenerative skeletal tissue disorders such as osteoarthritis and osteoporosis, the consortium will combine high performance materials and advanced nanotechnology to design an implant with unique properties which can influence site-specific tissue regeneration.

Under the ERA-NET scheme, projects are evaluated by a centralized selection committee, but each partner of the project is funded by its own country of origin. Therefore, although the EuroNanoMed projects have already been selected, before starting, these projects had still to go through ad-hoc national calls.

IBEC/UPC spin-off for surgical robotics

A new spin-off company created by IBEC and the UPC will focus on the manufacture and marketing of surgical systems.

Rob Surgical Systems Inc., a technology company driven by IBEC group leader Alicia Casals and senior researcher Manuel Frigola, as well as Josep Amat of the Automatic Control and Computer Engineering Department of the UPC, was approved by the university's governing council in December.

The company will manufacture the systems that IBEC's Robotics group has been developing in recent years. The first product will be a minimally invasive robotic station, Bitrack, which has advantages over those currently on the market since it occupies less space in the operating room. Its specially adapted user interface also enables a faster start-up, reducing the cost of interventions.

The new company will validate the initial prototype of Bitrack and obtain the certifications necessary to start marketing it in Europe and the United States. Rob Surgical Systems already has the support of the medical direction of the Mayo Clinic in Phoenix, Arizona, and aims to look for other alliances to expand the market.

2011 in review

Scientific highlights

January

Joining the fight against malaria

At the beginning of the year the Nanobioengineering group published a description in *J. Control Release* of a nanovector able to discriminate between blood cells infected with *P. falciparum*, the parasite that causes the most severe form of malaria, and non-infected cells for targeted drug delivery.

Current methods of administering antimalarial drugs deliver compound into the blood stream, where it can be taken up by all cells and not only by infected ones. The group used fluorescence microscopy to assess the efficiency of nano-sized liposomes, or carriers, which had been covalently functionalized with oriented, specific half-antibodies against late-form *P. falciparum*. They found that these 'immunoliposomes' docked to late-form infected membranes in 100% of cases, and not at all to non-infected cells.

With such a specific method of delivery, drug dosage could be adjusted to a low overall concentration, while still offering a guaranteed localized delivery of highly toxic doses only to parasitized cells. The findings also mean that existing drugs that are not being tested because of their high toxicity or elevated unspecificity may be used.

reveals differences between the reduced and oxidized states of a protein, that may be relevant to the control of ET rates in enzymes and biological electron transport chains.

"Methods to measure ET at the single-molecule level will help resolve temporal variations in enzyme activity that can be correlated with conformational changes to allow the ultimate miniaturization of nanodevices," explains group leader Pau Gorostiza.

The group also participated in a project led by researchers at the Institute for Materials Science of Barcelona, in which they characterized a robust molecular switch in solution that operates at very low voltages, can be 'patterned' by electrical input and has exceptionally high long-term stability, reversibility and reproducibility. "This switch is a very promising platform for use in memory devices," says Pau. These results were published in *Nature Chemistry* in March.

Intelligent design

Researchers in the Biomechanics and Mechanobiology group published a study in *Biomaterials* in February that revealed how the design of tissue engineering scaffolds can influence the distribution of adhering cells after perfusion cell seeding.

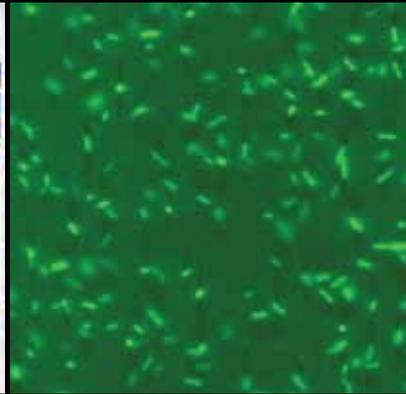

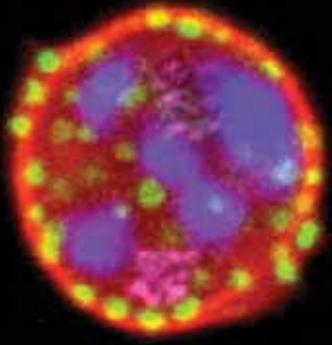

In designed porous structures, the ability to influence the distribution of seeded cells is fundamental to allow the controlled engineering of complex 3D tissue structures in specific shapes. Together with collaborators in the Netherlands and Switzerland, the scientists described a model system that assesses the influence of local fluid flow characteristics in designed porous scaffolding structures on the distribution of cells upon seeding. They found that the density of adhering cells correlates to the local average wall shear rate at the surface of the pore walls. While scaffolds with an isotropic gyroid pore network architecture show very homogeneous distributions of shear rates and cell densities after seeding, gyroid scaffolds prepared with gradients in pore size and porosity show anisotropic adherent cell densities. The highest cell densities in the scaffolds could be related to regions with larger pores, higher fluid flow velocities and higher wall shear rates.

February

Two papers for Nanoprobes group

IBEC researchers found a way to measure the rate of electron transfer (ET) – an important process which is essential in many chemical and biological processes such as cellular respiration and photosynthesis – at the single-molecule level.

In a study published in *ACS Nano*, members of the Nanoprobes and Nanoswitches group described how they used an electrochemical tunneling microscope to measure the 'distance decay constant' that characterises the rate of ET in redox proteins. Analysis of decay constant measurements

Confocal fluorescence microscopy study of the subcellular localization of monoclonal antibody BM1234 in *P. falciparum*; "We're made of glass" in *El Mundo*; Green fluorescence protein expression under the *nrdAB* promoter region in *P. aeruginosa*.

March

Electromechanics at the nanoscale

Flick a switch, turn a knob or pull a lever and you're operating an electromechanical device, albeit a complex one. In March an IBEC researcher and his collaborators broke new ground with a proven concept for the first such electronic component to operate using just a single-molecule electrical contact.

In a study published in *Nature Nanotechnology*, Ismael Díez Pérez, a researcher in IBEC's Nanoprobes and Nanoswitches group, and Nongjian Tao from Arizona State University described their success in attempting to find a way to simulate the same electromechanical effects achieved on conventional electronics, but in a single-molecule device that allows the accurate mechanical control of the current flow. Such devices would open up huge possibilities in being able to create things at an ever-smaller scale.

We're made of glass, say scientists

People can be brittle, transparent, shattered, or have a heart of glass. In March these attributes seemed all the more appropriate following a discovery by researchers that migrating cells in our bodies behave in a remarkably similar way to glass when it is heated and cooled.

In a study published in *PNAS*, IBEC's Xavier Trepat and his collaborators discovered that the movement of a collection of migrating cells is similar to a process called glass transition. Glass is, by definition, a non-crystalline solid that goes from brittle to molten when heated, and the other way around when cooled: this is glass transition, one of the great unsolved problems in physics. "Our results provide a startling analogy," says Xavier. "It had been predicted that over certain time scales, tissues might flow like fluids. What we've found shows that if cell density is below a certain amount,

then confluent cells (cells that move together) indeed flow like a fluid. However, as density increases, the collective dynamics of the cells progressively slow down, much as the molecules of molten glass slow down as it is cooled."

A glass-like behaviour of confluent cells has direct implications on collective cell migration and its purposes, so this new knowledge provides a framework for understanding the dynamics of wound healing or the metastasis of cancer cells.

April

Opening new doors to combat bacterial infections

We may be several steps closer to understanding one of the major pathologies that affects sufferers of cystic fibrosis, thanks to senior researcher Eduard Torrents of IBEC's Microbial biotechnology and host-pathogen interaction group.

In a study published in April in the American Society for Microbiology's journal *Infection and Immunity*, Eduard and his collaborator in Stockholm, Britt-Marie Sjöberg, looked at DNA synthesis in *Pseudomonas aeruginosa*, a bacterial infection that is a frequent complication in many people with cystic fibrosis, and a common cause of death in those patients. Focusing on ribonucleotide reductase enzymes, which are essential for cell division with a high fidelity duplication of DNA – a critical step in the life cycle all types of organisms – the researchers studied the expression of each of these type of enzymes during aerobic and anaerobic growth of *P. aeruginosa* and their role during infection.

"Ribonucleotide reductases control the only pathway to the deoxyribonucleotides which are required for DNA synthesis and repair," explains Eduard. "By studying them, we were able to examine the shift in expression of each during the infection process and so determine which ones in particular could be considered a good target to inhibit the growth of *P. aeruginosa* in chronic cases."

Scientific highlights *continued*

May

Plithotaxis: how crowds of cells find their way

IBEC's Integrative Cell and Tissue Dynamics group collaborated with Harvard investigators to come up with a brand new concept in biology, plithotaxis.

In the journal *Nature Materials* in May, IBEC group leader Xavier Trepate, together with Harvard researcher and IBEC ISC member Jeffrey J. Fredberg, shed light on how cells move within a monolayer cell sheet to enable the whole to migrate. "We'd long suspected that each cell exerts force not only upon its extracellular matrix but also upon neighbouring cells," explains Xavier. "Plithotaxis, which comes from the Greek *plithos*, meaning swarm, describes what we discovered when we devised a way to measure these forces: that each cell pushes and pulls on its neighbours in a chaotic 'dance', yet moving the whole cooperatively in its intended direction."

The discovery of a relationship between physical forces and individual cellular motions *in vitro* demands further tests to see whether it holds in *in vivo* tissues, and could open new avenues in predicting the movement of cancer cells.

was achieved by mimicking embryonic development of the hematopoietic system. The group's new protocol is much more robust and efficient than previous methods.

Identifying an essential interaction for epilepsy

In June scientists at IBEC described a major step towards understanding epilepsy in a paper published in *Molecular Biology of the Cell*.

The researchers shed new light on the importance of a neuronal protein known as PrPc. When mutated or misfolded, its pathogenic form induces progressive conditions that affect the brain and nervous system, such as Creutzfeldt-Jakob disease and BSE. In epilepsy, it appears that the healthy protein plays a preventative role.

"PrPc's modulation of GluR6 activity plays a key role in the activation of the pathway that leads to the disease," explains Patricia Carulla of IBEC's Molecular and Cellular Neurobiotechnology group. "PrPc in the neuron blocks the GluR6 receptor. Absence of PrPc, however, allows the formation of this three-molecule receptor complex which in turn leads to activation of the JNK3 pathway, resulting in increased epilepsy and cell death in the hippocampus."

The group is now speculating that a similar protective effect of PrPc may occur in other brain injuries sharing a similar activation mechanism where signalling is transmitted downstream via GluR6 to the JNK3 pathway. Increased levels of PrPc has been found in stroke patients, for example.

June

Turning skin into blood

In June, the Control of Stem Cell Potency group published a new, highly efficient protocol in the journal *Stem Cells* for generating multipotent hematopoietic progenitors from human pluripotent stem cell (iPSC) lines. iPSCs hold huge potential for the treatment of diseases thanks to their patient specificity and their similarity to embryonic stem cells, and the ability to generate hematopoietic cells from patient-derived iPSCs enables the generation of an unlimited supply of transplantable cells for the potential treatment of hematological disorders.

The new protocol, which was developed in collaboration with Inder Verma's lab at the Salk Institute, La Jolla, CA,

August

Researchers shed new light on predicting spinal disc degeneration

In August IBEC researchers took a big step towards understanding one of the most common and debilitating complaints in the industrialized world, lower back pain, with

results that could help to predict the onset of disc degeneration.

In a paper published in *PLoS Computational Biology*, they described some important findings gleaned from looking at the effect of outside influences on healthy and unhealthy discs. They showed that weight or pressure on already degenerated discs has less effect on the transport of nutrients and cell products than on healthy ones – and that changes in cell density in discs are fundamental to the process of disc degeneration.

“In a healthy disc, we see that sustained mechanical stress – which alters solute concentration – affects the transport of nutrients more drastically than in already degenerated ones, suggesting that loading in the healthy disc is important for maintaining proper metabolic balance,” explains Andrea Malandrino of IBEC’s Biomechanics and Mechanobiology group. “It’s safe to say that an alteration of cell number caused by this disturbance to the metabolic transport could result in the possible onset of disc degeneration.”

With the knowledge that both mechanical and cellular patterns contribute to maintaining a healthy condition, new avenues of research and development in the field of disc regenerative medicine have been opened up.

Offering insights into complex cell behaviour

In August Pere Roca-Cusachs of IBEC’s Cellular and Respiratory Biomechanics group and his collaborators in the US, France and Singapore revealed that an increase in the plasma membrane tension of adherent cells coordinates the activation of exocytosis and contraction during cell spreading, suggesting that cells use this tension as a global physical parameter to control their motility.

Tension in the plasma membrane is an important factor in a range of cellular phenomena, including cell migration and mitosis; however, little is known about how it regulates such processes. In a paper in *PNAS*, the researchers described how they monitored the tension in a spreading fibroblast from the initial rapid spreading phase to the subsequent contractile spreading phase, finding that this transition

between the phases is accompanied by a transient increase in membrane tension. To see if this tension increase was the signal responsible for activating the transition, they increased it artificially, causing an abrupt halt to the edge extension and an induction of exocytosis. This indicated that tension increase not only accompanies but can also trigger the transition.

Their findings highlight membrane tension as an important mechanical regulator of cell behaviour, and offer insights into the biochemical and biophysical aspects of cellular biology that contribute to a bigger picture of complex cell activity.

November

Revealing the basis of *E. coli* infection

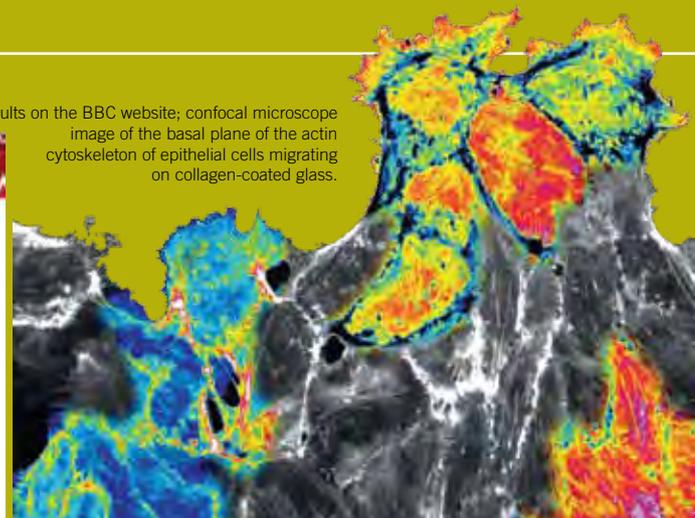

In a paper published in *PLoS Pathogens* in November, IBEC’s Microbial Technology and Host-pathogen Interaction group and their collaborators described a big step towards understanding the basis of selective regulation of virulence genes.

Their study revealed the structure of a complex between the DNA-binding domain of Ler, a master regulator of the pathogenicity island (the genetic element of an organism that is responsible for its capacity to cause disease) in virulent *E. coli* strains, and a DNA fragment.

Pathogenic *E. coli* strains carry genes acquired from other bacteria by horizontal gene transfer, and proper regulation of the correctly expressed genes is crucial for the success of the bacteria. The protein H-NS, of which Ler is a member, is a global regulator that binds DNA and keeps a large number of genes silent until they are needed.

The structure revealed by the study shows that Ler, which activates the expression of the horizontally acquired genes that are used by *E. coli* to infect human cells, recognizes specific DNA shapes, which explains its capacity to regulate genes with different sequences. This could offer insights into sustainable antimicrobial strategies that are less likely to acquire resistance.

The Biomechanics and Mechanobiology group’s *PLoS Computational Biology* results on the BBC website; confocal microscope image of the basal plane of the actin cytoskeleton of epithelial cells migrating on collagen-coated glass.

Figure 1. IBEC researchers and technicians by group

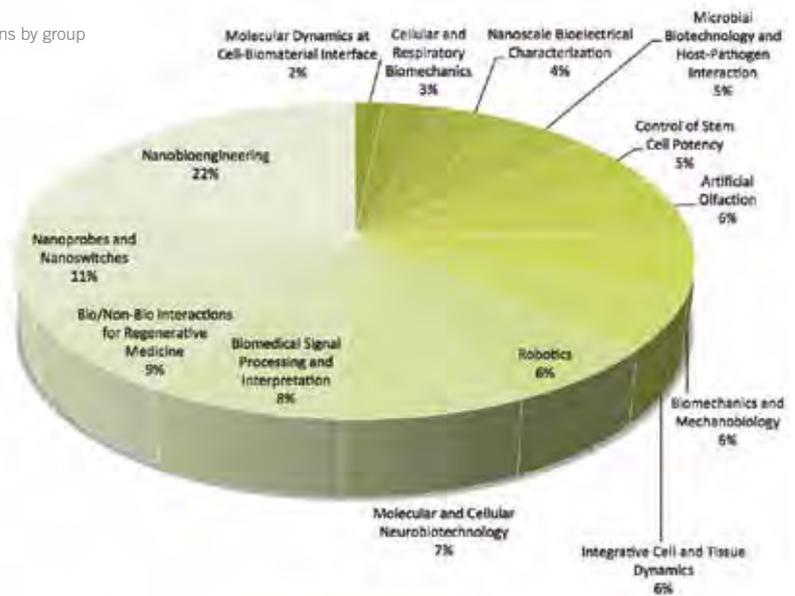

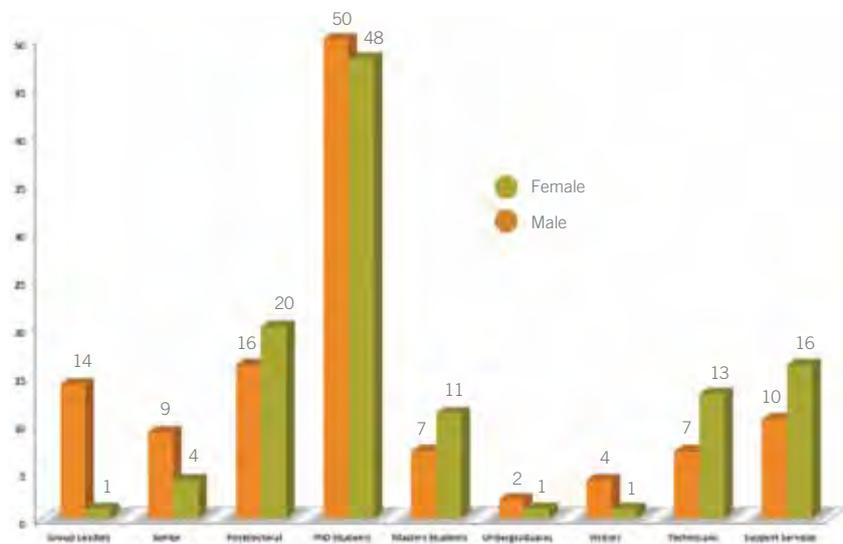

Figure 2. IBEC researchers, technicians and support services staff by gender and category

In 2011 IBEC's staff of researchers and expert technicians numbered 208. Some work on an in-house basis, some come from the University of Barcelona or the Technical University of Catalonia, and some are funded through programmes that support the recruitment of research staff such as the Bosch i Gimpera Foundation, ICREA and the Ramón y Cajal programme (MEC).

IBEC also employs a staff of 26 people to carry out support activities.

(All figures correct as of 31.12.11)

1. Structure and function of bacterial proteins that modulate virulence expression

Protein–protein and protein–DNA interactions play key roles in the ability of virulent bacteria to adapt to the host environment and cause disease. Two groups of proteins are currently the focus of our research: nucleoid-associated proteins (NAPs) that contribute to DNA architecture and modulate gene expression, and ribonucleotide reductases (RNRs), which are key enzymes in all living organisms providing the nucleotide precursors for DNA replication and repair. In the former group, we are interested in unravelling the role played by two of these proteins – Hha and H-NS – in the regulation of virulence and of plasmid transfer. In the case of the latter group, our current research objectives are to analyze the importance of bacterial RNRs in pathogenesis and the molecular mechanisms of gene expression and to identify new specific RNR inhibitors. Owing to their essential function, these enzymes offer excellent potential for combating bacterial infection.

2. Application of nanotools of bacterial biotechnology

2.1. Dielectrophoresis (DEP). We have previously shown that dielectrophoresis can be a valuable tool for bacterial cell sorting and characterization. We are currently using different chip designs (2D and 3D carbon electrodes) to: a) study the effect of electric fields on bacterial cell physiology; b) combine DEP with other molecular protocols for detection and identification of different types of cells.

2.2. Atomic force microscopy (AFM). Conventional AFM approaches have been shown to be powerful techniques for characterizing both biomaterials and biomolecules. In a joint project with the Nanoscale Bioelectrical Characterization group (page 50), we intend to use electrical-AFM to characterize the bacterial cell envelope. We also plan to use this approach to analyze the structural and physiological properties of bacterial living cells.

During 2011, the research group developed several studies aimed at understanding some of the processes of development and neurodegeneration of the central nervous system (CNS). Among these we demonstrated, in collaboration with other groups, the role of the cellular prion protein (PrP^c) in epilepsy. Our data indicate that PrP^c modulates glutamatergic neurotransmission by acting at the cell membrane together with the glutamate receptor subunits Glur6/7 and the postsynaptic density protein PSD-95. Thus the absence of PrP^c induces epilepsy by lacking the interaction with the glutamate receptor. In addition, we demonstrated that an intracellular kinase JNK3 is a target of PrP^c-mediated signaling. These data were included in a perspectives report in *Prion* (in press).

We also made progress in understanding the intracellular mechanisms responsible for the failure of axonal regeneration after CNS injury. In this area, we described the involvement of the intracellular kinase GSK3 β in the inhibitory effects of myelin-associated molecules. Current pharmacological studies using microfluidics are analyzing the putative effect of specific inhibitors of GSK3 β to increase axon regeneration.

From the technological point of view, the group published a methodological review in *Nature Protocols* (published in 2012) on the usefulness of three-dimensional culture with hydrogels in neurobiological studies. Moreover, in collaboration with other IBEC groups, we have characterized the role of myelin-associated proteins and their intracellular signaling cascades in the development of cell therapies using olfactory ensheathing cells, which are inhibited by myelin. In collaboration with Xavier Trepats' group (page 39) we determined, for the first time, the behaviour of these cells using biomechanics and traction force analysis (*Cellular and Molecular Life Science*, in press). Current experiments in our groups are focused on avoiding this inhibition in order to increase the effectiveness of this cell type after spinal cord lesion.

Finally, group members have collaborated on the study of the analysis of the role of Epidermal Growth Factor roles on the normal development and disease, and how they affect cell proliferation and survival. To analyze this we have used a combined approach to study the EGF dependent transcriptome of HeLa cells by using multiple long oligonucleotide-based microarray platforms (from Agilent, Operon, and Illumina) in combination with digital gene expression profiling (DGE) with the Illumina Genome Analyzer.

A) Example of LEICA SP5 spinning disk confocal microscopy picture showing several CA1 pyramidal neurons of the hippocampus microinjected with fluorochromes. This observation is useful to analyze the dendritic morphology and its putative changes in mouse models of neurodegenerative diseases. B) Example of 3D reconstruction of a dendritic segment showing its spines using Silicon Graphics Imaris™ software.

Control of Stem Cell Potency

Group leader: Prof. Dr. Ángel Raya

Postdoctoral researcher: Dr. Sergio Mora, Dr. Adriana Rodríguez

Research assistants: Yvonne Richaud, Senda Jiménez, Cristina García

PhD students: Claudia Di Guglielmo, Isil Tekeli, Juan Luis Vázquez

Masters students: Bahaa Arefai

Undergraduates: Patrizia Benzoni, Marta Farrés, Andrea Blanco

Visiting students: Isaac Canals, Elisabetta Crescini, Martín Muñoz

During embryo development, the potency of the zygote is deployed through coordinated and stereotypical changes in cell behaviours and processes of tissue patterning, ultimately resulting in the formation of an entire, highly complex organism in a relatively short period of time. Throughout this process, the developmental potency of individual cells, i.e. their ability to give rise to cells of a different type than their own, is progressively lost, so that somatic cells in adult individuals retain very limited potency (such as in rare adult stem cells) or show no potency at all.

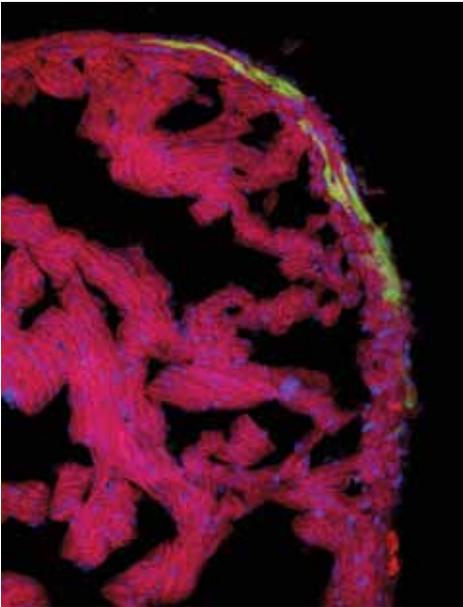

Our laboratory is interested in understanding the mechanisms that govern the degree of potency of human somatic cells, and how it can be experimentally increased for conditions where doing so may be of biomedical relevance. Specifically, the context in which we investigate these issues is mainly centred on the paradigm of cardiac regeneration/repair.

Heart-related diseases are the main cause of mortality in the world, with ischemic heart disease being the single most frequent condition accounting for the death toll. This results from the very limited ability of the mammalian heart to regenerate on its own, and underscores the pressing biomedical need to finding ways for potentiating this ability (heart regeneration) and/or providing new cardiac cells to replace the lost or damaged ones (heart repair). We pursue the first approach by studying the process of heart regeneration in the zebrafish, an organism with a remarkable regeneration capacity. Natural regeneration is a biologically fascinating phenomenon in which somatic cells may regain developmental potency, and we hope that understanding the molecular and cellular mechanisms that control this process will help devising strategies to potentiate the regeneration of adult mammalian hearts.

For achieving heart repair, in turn, our research is aimed at generating functional human heart muscle cells that could be used for transplantation. For this purpose, we investigate ways to manipulate the developmental potency of human somatic cells so they become pluripotent (i.e. regain the potency of cells in the early embryo), and then study how these so-called induced pluripotent stem cells (iPSC) can be instructed to differentiate into functional cardiomyocytes. In addition, since iPSC can

Colonies of human iPSC cells showing high alkaline phosphatase activity (blue staining).

Section of a zebrafish heart showing a patch of genetically-labelled cells in green, and cardiomyocytes stained in red.

be generated from disease-carrying cells, many laboratories including ours are exploring the possibility of using patient-specific iPSC to generate disease-relevant cell types in which to investigate the pathogenic mechanisms of disease initiation and/or progression.

Overall, our research takes advantage of a variety of experimental paradigms (zebrafish heart regeneration, human iPSC generation and differentiation), approached from a multi-disciplinary perspective, ranging from bioengineering approaches to 3D stem cell differentiation to single-cell genetic lineage tracing analyses and genetic manipulation of human cells, aimed at tackling important current issues in biology and biomedicine, such as the mechanisms that control the establishment and maintenance of developmental potency, the initiation and progression of the regenerative process, and the differentiation and functional maturation of human cardiomyocytes, and the development of genuinely-human models of human disease.

Cellular and Respiratory Biomechanics

Group leader: Prof. Dr. Daniel Navajas

Senior researchers: Dr. Pere Roca-Cusachs

PhD students: Tomàs Luque González

Masters student: Anita Joanna Kosmalska,
Laura Schaedel

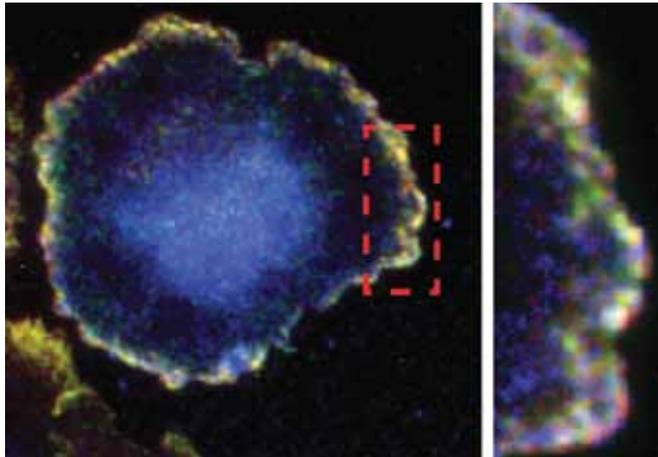

Our goal is to gain a better understanding of cellular and respiratory biomechanics in order to improve the diagnosis and treatment of respiratory disease. Our work is organized into two interrelated areas, focusing on respiratory mechanics at both the systemic and the cellular level. We use basic and translational approaches in a multidisciplinary framework involving cooperation with clinical research groups working in the field of respiratory medicine.

At the systemic level, we study the mechanical properties of the airway and lung tissues and the changes that occur in the context of the mechanical dysfunction associated with respiratory diseases. We study the mechanics of the upper airway in sleep apnea syndrome and on mechanical ventilation in acute and chronic respiratory failure. We biofabricate engineered lungs by recellularizing lung scaffolds with stem cells.

At the cellular level, we develop and apply cutting-edge nanotechnology and advanced biophysical techniques to probe the mechanical behaviour of cells and their mechanical interactions with their microenvironment. We study the mechanical properties of the cell and its response to inflammation and mechanical stresses and develop new approaches to differentiate stem cells using mechanical stimuli. We are developing a lung-on-a-chip model recreating the *in vivo* mechanical micro/nano-environment of lung cells. Magnetic tweezers and atomic force microscopy are also combined with molecular biology and advanced optical microscopy with the aim of understanding how cells detect and respond to mechanical stimuli. Using this approach we have, for instance, revealed that different integrins are adapted to sensing versus resisting forces or that talin molecules can detect forces by stretching and exposing cryptic binding sites to vinculin. Ultimately, when we determine the molecular mechanisms that communicate cells with their environment, we will understand how forces determine development when things go right and tumour formation when they go wrong.

Group leaders: Prof. Dr. Pau Gorostiza and Prof. Dr. Fausto Sanz

Postdoctoral researcher: Dr. M^a Isabel Bahamonde, Dr. Felipe Caballero Briones, Dr. Ismael Díez Pérez, Dr. Kay Eckelt, Dr. Olga Esteban, Dr. Marina Inés Giannotti, Dr. Ana Trapero

PhD students: Juan Manuel Artés, Antonio Bautista, Xavier Gómez, Javier Hoyo, Mercè Izquierdo, Helena Masanas, Andrés Martín, Anna Palacios, Silvia Pittolo Lorena Redondo

Masters student: Míriam Ferrer, Montserrat López, Josep Relat

Undergraduates: Arnaud Giraudet, Lia Lima, Cristina Rivero

Technicians: Dr. Núria Camarero, Èric Ferrer, Ariadna Pérez

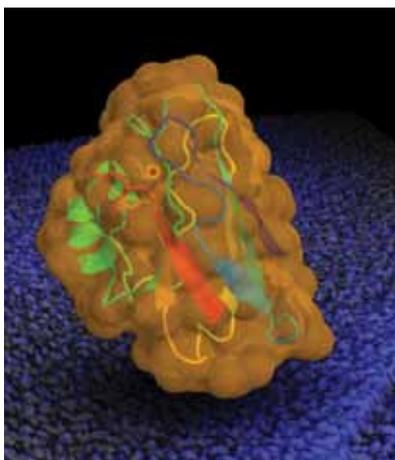

Visitor: Alfredo Maria Gravagnuolo

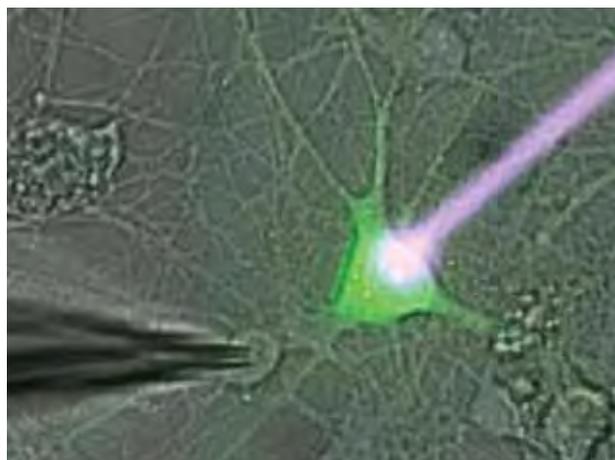

The group's research focuses on developing nanoscale tools to study biological systems. These tools include instrumentation based on proximity probes, such as electrochemical tunnelling microscopy and spectroscopy, that we apply to investigate electron transfer in metal oxides and individual redox proteins.

These studies are relevant to the development of biosensors and molecular electronics devices. In particular, we have recently published a method to measure directly the distance decay constant that characterizes the rate of electron transfer (ET) in redox proteins, and we have reported single protein junctions consisting of azurin bridged between a gold substrate and the probe of an electrochemical tunneling microscope, which constitute a proof-of-principle of a single redox protein field-effect transistor. Another set of nanotools that we are developing is based on molecular actuators that can be switched with light, such as azobenzene, which can be chemically attached to biomolecules in order to optically control their activity.

We are specifically interested in the processes of neurotransmitter secretion by exocytosis and membrane recycling by endocytosis, which are the fundamental phenomena that occur at the synaptic terminal and that participate in the communication between neurons. We have recently set up a method to control neurotransmitter exocytosis with light at the presynaptic compartment by activating a calcium-permeable, light-gated glutamate receptor (LiGluR) in cultured cells. Presynaptic expression of LiGluR in hippocampal neurons enables direct and reversible control of neurotransmission with light, and has allowed for the first time to modulate the firing rate of the postsynaptic neuron with the wavelength of illumination.

Crystal structure of redox protein azurin (Protein Data Bank entry: 1AZU) displaying its solvent accessible surface (gold) superimposed on the tertiary structure (rainbow) and a red sphere indicating the copper ion. When an atomically flat gold electrode is coated with azurin, the protein can be imaged under potentiostatic control by electrochemical tunneling microscopy (3D rendering of a 100x100nm² area shown in blue), and its electron transfer properties can be investigated by current-distance spectroscopy (Juan Manuel Artés *et al.*, *ACS Nano* 2011).

Representation of the invasive manipulation of neuronal activity by means of a conventional glass electrode in contact with the neuron on the left, and noninvasively by means of a focalized light beam over the green neuron on the right (Photomontage: Mercè Izquierdo).

Masters students: Sònia Pintor

Technician: Maria Angeles Bintanel

Cell motility and tissue dynamics

The ability of eukaryotic cells to migrate within living organisms underlies a wide range of phenomena in health and disease. When properly regulated, cell migration enables morphogenesis, host defense and tissue healing. When regulation fails, however, cell migration mediates devastating pathologies such as cancer, vascular disease and chronic inflammation. Our research focuses on understanding the fundamental biophysical mechanisms underlying migration both at the single cell level and at the tissue level.

Cytoskeletal fragility

With every beat of the heart, inflation of the lung or peristalsis of the gut, cell types of diverse function are subjected to substantial mechanical forces. How cells sense and respond to such forces underlies fundamental biological functions including differentiation, proliferation, polarization, locomotion, invasion, gene expression and pattern formation. We recently identified a new class of universal cellular responses to mechanical forces we termed “cytoskeletal fluidization” (Trepap *et al* (2007), *Nature*). The existence of this response class implies that the cytoskeleton of the living cell should no longer be regarded as a robust and stable scaffold but as a fragile one that is able to fluidize and quickly reorganize to adapt to its active mechanical environment. Our current research focuses on better understanding the functional implications of cytoskeletal fluidization and elucidating the underlying physical mechanisms.

Research projects

The Nanobioengineering group is a truly multidisciplinary team composed by researchers coming from very diverse backgrounds (chemistry, physics, material science, electronic engineering, pharmacy and molecular biology) and working together in applying nanotechnology to the development of new bio-medical systems and devices, mainly for diagnostic purposes. The main activities of the group involve the physical and chemical functionalization of materials for the study of biomolecule and cell interactions and for the development of new biosensors that will be integrated in lab-on-a-chip devices. The technology and results obtained in the laboratory are employed in medical applications ranging from portable diagnosis devices to implantable prostheses for regenerative medicine purposes.

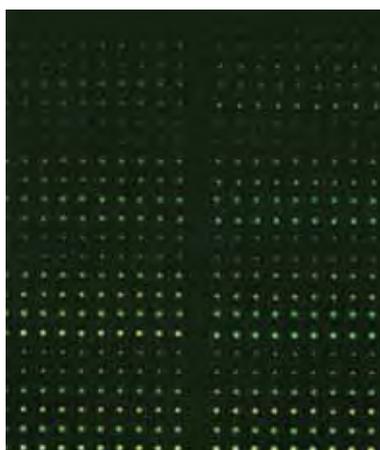

The projects carried out by the group are focused on clinical and industrial problems and are related to four convergent research lines:

1. Optical and electrochemical biosensors for clinical diagnosis and food safety applications

- DNA sensors for detection of cancer biomarkers
- Antibody-based sensors for detection of pathogenic microorganisms
- Aptamer-based sensors for detection of toxins
- Olfactory receptor-based sensors for detection of odorants and volatile compounds
- Polymer nanowires-based biosensors

Gold electrodes on PEN with a minimum feature size of 6 ± 1 μm over a maximum substrate size of 10 cm in diameter. © DVT-IMP project.

Representative fluorescence scanner image of an α -PMMA protein microarray.

2. Bio/non-bio interfaces and micro/nano-environments for biomedical studies and regenerative medicine applications

- Design, production and characterization of micro/nanoenvironments with different biocompatible materials for cell behaviour studies (adhesion, proliferation, differentiation)
- Design, production and characterization of scaffolds with a topography and chemical composition controlled at the nanoscale for ocular and cardiac tissue regenerative therapies based on stem cells

3. Microfluidic systems for biological studies and lab-on-a-chip devices

- Microfluidic chip for blood/plasma filtering
- Microfluidic chip using hydrodynamic focusing for bacteria counting and sorting
- Microfluidic chip for reagent handling in POC diagnosis devices

4. Nanotechnology applied to biomolecule interaction studies

- Liposome-based nanovectors and nanoparticles for drug delivery
- Magnetic nanoparticles–biomolecules interactions and their applications

Single Molecule Bionanophotonics (until July 2011)

Group leader: Prof. Dr. María García-Parajo

Postdoctoral researchers: Dr. Olga Esteban,
Dr. Carlo Manzo

PhD students: Gemma Pérez, Juan Andrés
Torreño, Thomas van Zanten

Technician: Merche Rivas

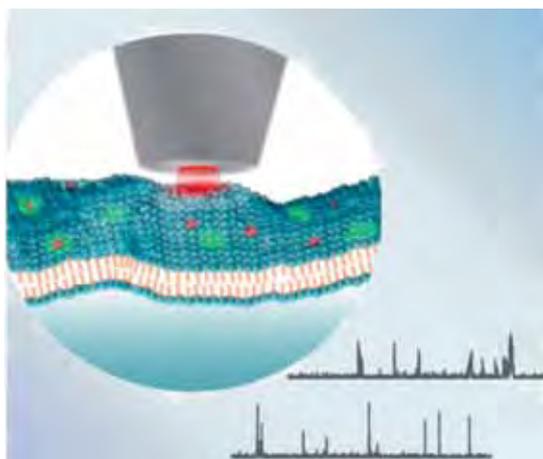

The Single Molecule Bionanophotonics group devotes its research activities to the development and application of cutting-edge optical techniques for the study of biological processes at the single molecular level and on living cells. Thus we aim to develop fluorescence techniques that combine high spatial and temporal resolution for the dual goals of probing and manipulating biological function at the level of single molecules in their native environment: the living cell.

Nanoscale imaging on intact cell membranes is obtained using near-field optical microscopy (NSOM). We also generate strong nanoscale optical fields and superfocusing by fabrication of optical nano-antennas, tuned in resonance with the photon emitters. These nano-antenna probes scanned in controlled proximity to cell membranes allow optical resolution below 30nm. High temporal resolution is achieved using fluorescence correlation spectroscopy (FCS) and Epi/Total internal reflection fluorescence microscopy (TIRF) for single emitter tracking on living cells.

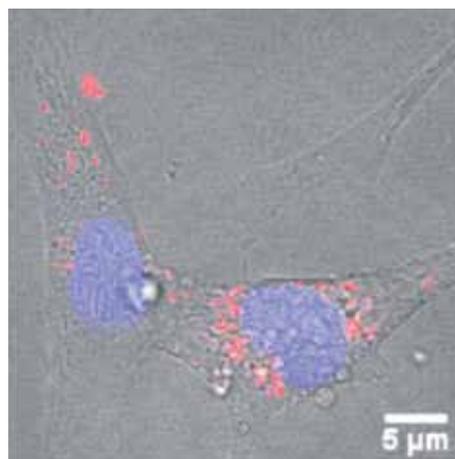

Our aim is to elucidate fundamental biological questions that have important implications for health and disease. Topics that attract our attention in the biological arena are cell membrane compartmentalization at the nanoscale, leukocyte adhesion mediated by integrin receptors and pathogen recognition by cells of the immune system.

As highlights of our achievements in 2011 we demonstrated the feasibility of fluorescence correlation spectroscopy (FCS) based on the nanometric illumination of near-field scanning optical microscopy (NSOM) probes on intact living cells (*Biophys. J.* (2011), 100, L08). NSOM-FCS applied to fluorescent lipid analogs allowed us to reveal details of the diffusion hidden by larger illumination areas. Moreover, the technique offers the unique advantages of evanescent axial illumination and straightforward implementation of multiple colour excitation. In collaboration with the group of Prof. F. Sanz (page 36) we evaluated the potential of functional polyelectrolyte based nanoparticles as nanocarriers for lysosomal delivery of therapeutic proteins (*Biomacromolecules* (2011), 12, 2524). Using high-resolution fluorescence microscopy we characterized at the single particle level the binding, cellular uptake and successful delivery of these nanocarriers to lysosomal compartments.

The Single Molecule Bionanophotonics group left IBEC in July 2011 and now continues its work at the Institut de Ciències Fotòniques (ICFO).

Artist's impression of how a subwavelength aperture probe as used in NSOM locally excites a nanometric region of the cell membrane allowing the recording of fluorescence bursts arising from the diffusion of lipids on the membrane.

Confocal fluorescence micrograph of cells incubated with Atto647N-labeled nanocarriers containing the enzyme α -Gal (red). The image shows the successful uptake of the nanoparticles.

Postdoctoral researchers: Dr. Annalisa Calò, Dr. Martin Edwards

PhD students: Aurora Dols-Pérez, Daniel Esteban, Georg Gramse

Masters student: Payman Mosaffa

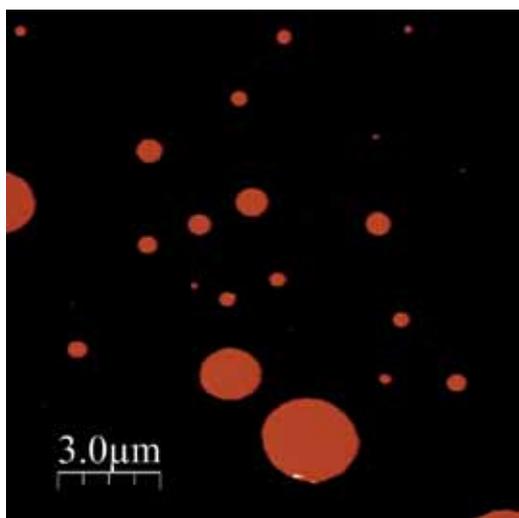

The main goal of our research group is to develop new experimental setups based on atomic force microscopy and theoretical frameworks enabling us to measure and understand the electrical properties of biological samples at the nanoscale (for example, biomembranes, single biomolecules and single cells). Our main objective is to contribute to the development of new label-free biological characterization methods and of electronic biosensors.

During 2011 we have extended the applicability of quantitative electrostatic force microscopy to biosystems with non-planar geometries. Ongoing work in advanced stages of development includes the analysis of the nanoscale dielectric properties of single bacteria and of single dielectric nanoparticles. Moreover, we have advanced significantly in extending quantitative electrostatic force microscopy to liquid environments, in understanding the adsorption of natural nanovesicles containing olfactory receptors onto solid supports for biosensor applications, and in preparing heterogeneous supported lipid bilayers stable in air to be used as model systems.

Topographic atomic force microscopy image of a spin coated DOPC lipid layer on a mica substrate stable in dry air environment. We have demonstrated that the background in the image corresponds to a single lipid monolayer around 1.3 nm thick, while the patches correspond to an inverted lipid bilayer around 4.5 nm thick.

Topographic atomic force microscopy image of two natural membrane nanovesicles adsorbed on a glass substrate and imaged under physiological buffer. The membrane nanovesicles were obtained from the disruption of yeast cells expressing olfactory receptors. We have demonstrated that nanovesicles upon adsorption on the substrate flatten to an aspect ratio around 0.1 but remain closed.

The research activities of the Bio/non-bio Interactions for Regenerative Medicine group are focused on the development of new biomaterials for tissue regeneration. Bioactive and biodegradable materials are studied and both fundamental and applied knowledge on their interactions with biological entities are developed to enable tissue engineering, which consists of the repair and the functional restoration of tissues or organs by means of 3D scaffolds, cells and signals. In order to fulfil its scientific strategy, the research group masters its own fabrication techniques of 3D scaffolds with tailored geometry and mechanical properties, as well as its own methods of surface functionalization with different biochemical cues to signal the biological environment. It also has the capacity to isolate and culture stem and precursor cells for the *in vitro* biological characterization of scaffolds and the development of tissue engineered constructs.

In 2011, important progress was made in all these topics. The group advanced in the synthesis of new materials; in particular, blended bioactive ormoglass/poly(lactic acid) hybrids with both angiogenic and osteogenic potential were obtained. Regarding the fabrication of 3D scaffolds, electrospun polymer fibres with covalently bonded bioactive coatings were achieved. New protocols for the fabrication of rapid prototyping (RP) scaffolds with well-defined and reproducible architectures were set for various polymers. In addition, a new method to fabricate biodegradable micro- and nanoparticles without involving toxic chemicals was successfully accomplished, and a functionalisation method was developed to introduce biomolecules to the surface of nanofibers, RP scaffolds and microparticles in order to provide cells with the right signals. The combination of these controlled manufacturing processes, together with biofunctionalisation, has been tuned for different clinical applications such as ophthalmology, the nervous system, skin and bone.

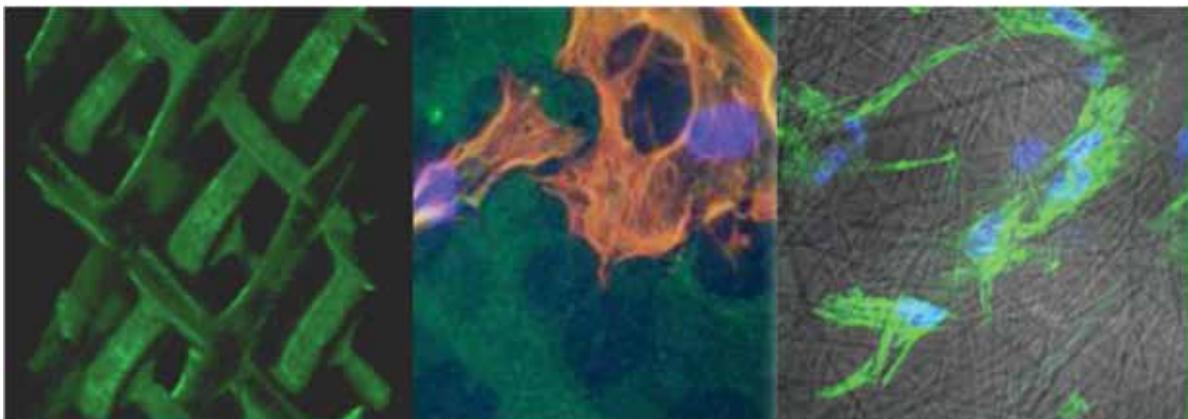

Three-dimensional biodegradable Rapid Prototyping scaffold (left); biodegradable polymeric microparticles (centre); hybrid electrospun nanofibres (right).

In the biological field, the effect of biomaterials' ionic release on progenitor cells homing, proliferation and differentiation was demonstrated. In particular, the stimulation of angiogenesis and osteogenesis and up-regulation of key genes on bone and vessels formation was shown. Electrospun PLA fibres implanted in rats brain cortex were found to support neuron collonization and to promote capillary formation.

From 2012 the Bio/Non-Bio Interactions for Regenerative Medicine group will be known as the Biomaterials for Regenerative Therapies group. The new name better reflects the aims and scientific strategy of the group, whose strength lies in the development of smart biomaterials to achieve a successful regeneration of tissues or organs.

What cells recognize, secrete and remodel at the biomaterials interface is the provisional extracellular matrix. How it relates to the biocompatibility of materials and how we can control these processes from the materials site is the main topic of our research. We aim to control matrix protein remodelling at the cell-material interface by engineering the material properties.

We perform systematic studies in the following directions:

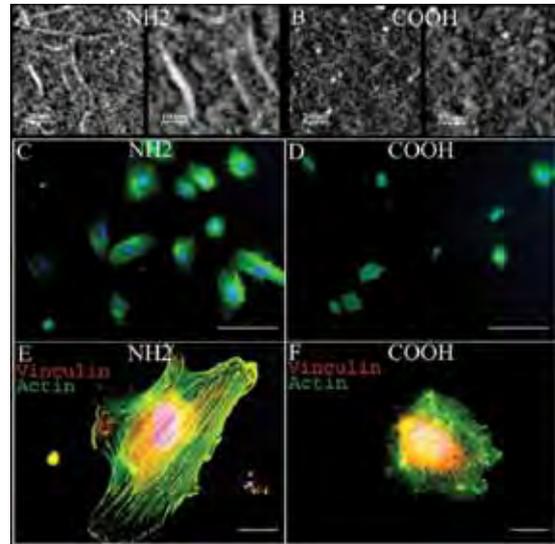

- Materials surface driven assembly of ECM proteins at the nanoscale;
- Cellular interaction with biomimetic nanostructures and networks;
- Electrospinning of nanofibres from natural and synthetic polymers for guiding cellular behaviour;
- Remodeling of ECM proteins at cell-biomaterials interface;
- Integrin dynamics.

ECM remodelling occurs in various physiological and pathological processes, such as normal development, wound healing and angiogenesis, but also in atherosclerosis, fibrosis, ischemic injury and cancer. It consists of two fundamental processes, assembly and degradation. ECM organisation at the biomaterial interface depends on the allowance of cells to rearrange adsorbed matrix proteins; we anticipated that materials that bind proteins loosely will support the arrangement of a provisional ECM. However, the ECM undergoes also proteolytic degradation, which is a physiological mechanism for the removal of excess ECM.

Even though matrix remodelling is a subject of extensive biomedical research, the way it is related to the biocompatibility of materials is poorly understood. Recently we have employed distinct silane chemistries and polymer compositions to create model substrates with tailored density of OH, COOH, NH₂ and CH₃ groups, thus varying in their chemistry, charge and hydrophilic/hydrophobic balance. In a series of communications combining AFM and other nanoindentation techniques, we have described a novel phenomenon of substratum-driven protein assembly depicting the fate of various matrix proteins such as fibronectin, collagen IV, vitronectin and fibrinogen at the above model

Novel type of hybrid PLA-fibrinogen nanofibres deposited as random (a) or aligned (b). It was shown that they induce distinct functional response in endothelial cells, which acquire either stellate (c) or elongated (d) morphology, respectively (Gugutkov *et al*, 2011).

AFM images of adsorbed collagen type IV on NH₂ (A) and COOH (B) model surfaces. They are shown on the upper panel in two magnifications that increase from left to right. Adsorption concentration is 50 mg/ml. The middle panel represents the overall morphology of endothelial cells adhering for 2 hours on the same substrata (C vs. D). On the lower panel the single cells are stained simultaneously for actin and vinculin to show the alterations in the focal adhesion complexes on COOH (E vs. F) (Coelho *et al*, 2011).

biomaterials interfaces. We show that with varying the density of chemical functions we can tailor both the assembly and degradation of proteins; we aim to obtain a control on ECM remodelling by engineering the material properties. On the other hand, proteins can form objects of various shapes, and a fascinating possibility is to make nanofibres. We further anticipated that the organization of nanofibres might be used for guiding the cellular behaviour; therefore we electrospun nanofibres from some natural (fibrinogen) and synthetic (PLA) polymers and successfully employed them for this purpose.

Masters students: Edouard Fulchin, Antonio José Sánchez, Natalia Valencia

Technicians: Rafael López

The focus of the Biomechanics and Mechanobiology research group is the study of the effect of mechanical stimuli on biological response. The group's objective is to make scientific advancements in simulations of *in vitro* and *in vivo* biomechanics and mechanobiology and in experimental *in vitro* mechanobiology. The current focus of the group is mainly on the development of simulations in spine biomechanics, tissue engineering and cell mechanics. These numerical simulations based on the finite element method are complemented with *in vitro* tests using bioreactors and microfluidic chambers.

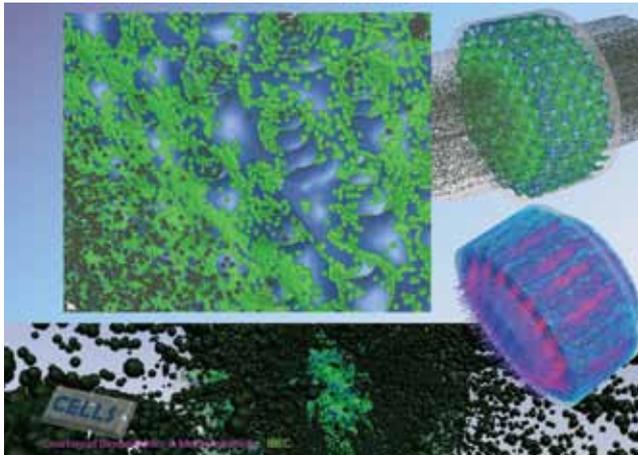

In 2011, major progress was made in all these areas of interest. In tissue engineering, an integrative collaborative study of cell adhesion in rapid prototyping scaffolds in which our group developed a computational fluid dynamics study has shown that the shear stress distribution in the wall of the scaffolds could be related to *in vitro* cell adhesion (*Biomaterials* 32, 2878-2884). This major result highlighted the importance of the local stimuli instead of looking at the global pore size distribution (*Acta Biomaterialia* 7, 478-484).

A new micro-finite element study of an irregular scaffold was also able to predict tissue formation in a calcium phosphate scaffold (*Biomechanics and Modeling in Mechanobiology* 10, 465-476). Related work in orthopaedics in the group successfully predicted fracture healing in a 3D model of the tibia (*J. Orth. Res.* 29, 1496-1503) and studied for the first time the stress distribution in the donning procedure of a prosthetic transfemoral socket (*Annals of Biomedical Engineering* 39, 2972-2983).

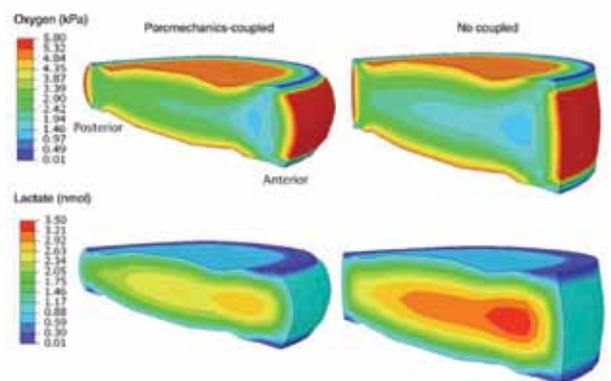

In spine biomechanics the effect of changes of collagen criss-cross angles in the annuli fibrosi of lumbar spine was studied (*Biomechanics and Modeling in Mechanobiology* 10, 203-219). A comparison of four methods to simulate swelling in poroelastic finite element models of intervertebral discs was performed (*J. Mechanical Behavior of Biomedical Materials* 4, 1234-1241). For the first time coupling between mechanical loading and solutes (oxygen and lactate) transport in the intervertebral disc was developed to study their effect on disc degeneration (*PLOS Computational Biology* 7, 8 1-12).

In the area of cell mechanics, progress has been made in the development of a single cell finite element model and in the study of the effect of microfluidic flow on cell attachment.

Finally, during 2011 Damien Lacroix was awarded a European Research Council Starting Grant (MECHANOBIO ERC-2010-StG_20091028) on finite element simulations of tissue engineering. This project started in October 2011 and will last five years.

Biomedical signal processing and interpretation

Group leader: Prof. Dr. Raimon Jané

Senior researchers: Dr. José Antonio Fiz, Dr. Beatriz Giraldo, Dr. Abel Torres

Postdoctoral researchers: Dr. Ainara Garde, Dr. Christian Morgenstern, Dr. Jordi Solà-Soler

PhD students: Joana Mesquita, Leonardo Sarlabous, Oiane Urria

Masters students: Alejandro Calvo, Mirella López, Beatriz Martínez

Research technicians: Maria Puy Ruiz de Alda, Manuel Lozano, David Montilla

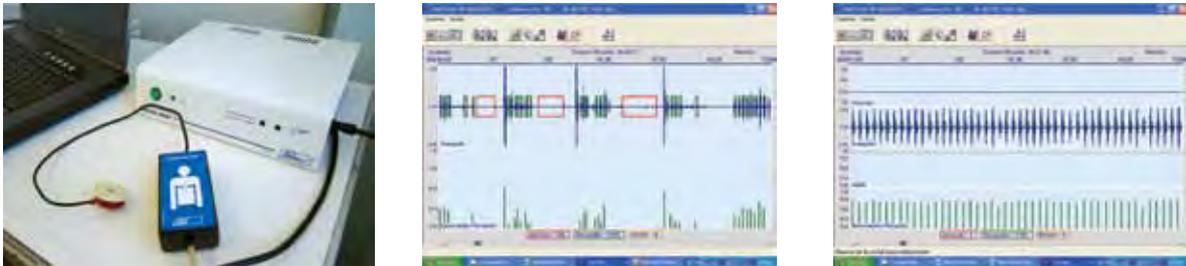

The group's research addresses the design and development of advanced signal processing techniques and the interpretation of biomedical signals to improve monitoring, diagnosis, disease prevention and pathology treatment. We explore new methods and techniques for multi-channel and multimodal acquisition, processing, modelling and interpretation of clinically relevant information from biomedical signals. Our main objective is to improve the non-invasive diagnosis capability through the characterization of physiological phenomena, and to enhance early detection of major diseases.

The specific objectives of the group are the proposal and design of novel signal processing algorithms and the development of a new biosignal databases developed jointly with hospitals to assess and validate the performance of the developed algorithms. To validate the clinical information of some new surface signals, we developed specific invasive/non-invasive protocols with the collaboration of our hospital partners. Currently, we are also studying the proposed algorithms in animal models to test performance in studies with well-controlled physiological conditions.

The group focuses its research in a translational way to promote that scientific and technology contributions can be transferred. Currently, our scientific prototypes are used in the hospitals for research purpose and for industrial developments.

Highlights in 2011:

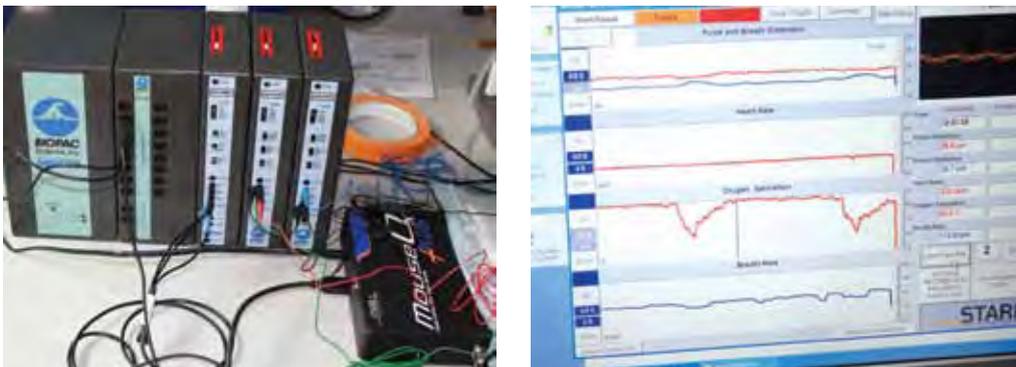

- We have proposed a new method for classifying snoring subjects according to their Sleep Apnea Hypopnea Syndrome (SAHS) severity and an original definition of regular and non-regular snores, as a novel powerful tool for screening SAHS severity, in collaboration with the Hospital Germans Trias i Pujol, Badalona.
- We have evaluated different methods to estimate the upper airway respiratory resistance, in collaboration with the Institute of Biomedical Engineering (Karlsruhe), the Klinikum Bethanien and the company MCC-Med, Germany.

Respiratory sound detection and interpretation in a novel single channel portable device for snore-based screening of Sleep Apnea-Hypopnea Syndrome (SAHS).

- We developed a method to study the respiratory flow cycle morphology in Chronic Heart Failure and the respiratory pattern in critical patients with mechanical ventilation, in collaboration with the University of Lund, Sweden, and the Hospital de Sant Pau, Barcelona.
- We proposed a new method to assess the respiratory muscle efficiency in patients with Chronic Obstructive Pulmonary Disease, in collaboration with the Hospital Germans Trias i Pujol and the Hospital del Mar, Barcelona.
- We designed a multimodal protocol for a rat model of SAHS in collaboration with the Biophysics and Bioengineering Unit of the School of Medicine, University of Barcelona.

Multimodal biosignal interpretation in a SAHS rat model.

Scientific equipment and techniques

- BIOPAC system for multichannel cardiac, respiratory, neural and muscular biomedical signal acquisition
- Non-invasive Vital Signs Monitor for small lab animals (mice and rats) (Mouse-Ox Plus)
- Databases of biomedical signals from Hospitals and Animal Laboratories
- Snoring analyzer equipment (SNORYZER)
- Sensors, electrodes and microphones to obtain cardiac, respiratory, neural, muscular and sleep biomedical signals
- Polisomnographic equipments available in the Sleep Laboratory of collaborator Hospitals
- Beat to beat arterial blood pressure and haemodynamic monitor equipment (FINOMETER)
- Research laboratory with full equipment for acquisition and processing of Biomedical Signal to test new sensors and to define clinical protocols (preliminary tests and control subjects).
- Computing server for high performance biomedical signals

Artificial Olfaction

Group leader: Dr. Santiago Marco

Senior researcher: Dr. Agustín Gutiérrez

Postdoctoral researcher: Dr. Jordi Fonollosa

PhD students: Ariadna Bartra, Lluís Fernández, Ana Verónica Guamán, Sergio Oller, Marta Padilla, Erola Pairó, Víctor Pomareda, Francisco Miguel Tarzán

Technicians: Idoya Agudo, Didier Domínguez, Miguel Lechón, Pablo Meca, Sergi Udina

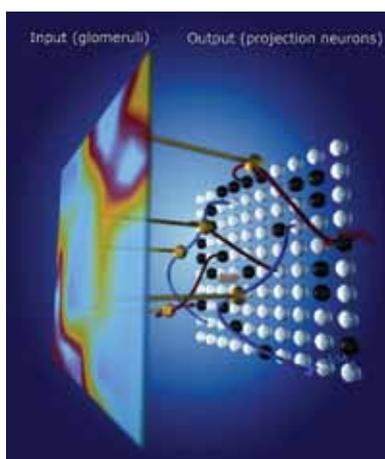

Visitors: Bernd Friedl, Lucas Georges, Zeev Karpas, Masoumeh Mohammadnejad, Davide Polese

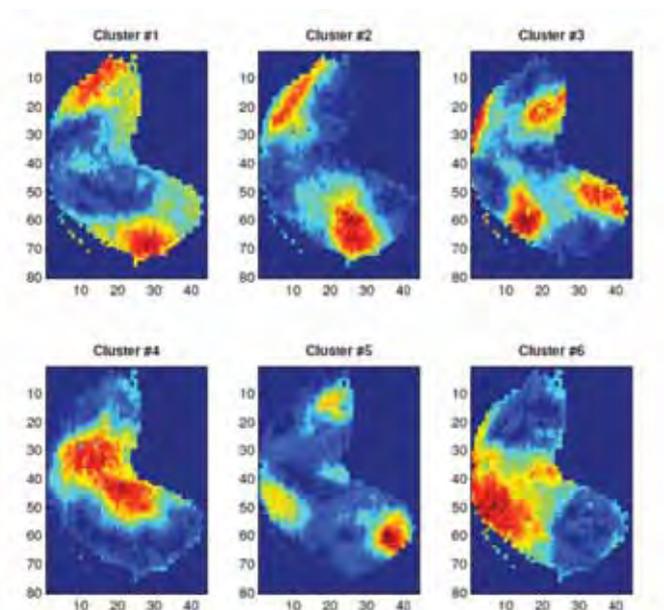

Artificial olfaction (AO) systems are intelligent chemical instruments for the detection of volatile compounds and smells. These systems usually combine an array of nonspecific chemical sensors with a pattern recognition system. The emphasis is not on the identification and quantification of the individual components – as is the case with analytical instruments – but rather on the overall evaluation of the odour. Moreover, AO systems tend to favour miniaturised devices capable of analyzing an odour in seconds. The focus of our research in this field is the development of signal and data processing systems inspired by the neuronal processing of the biological olfactory pathway.

Our research in 2011 included the following:

- Within the framework of the European NEUROCHEM project for the development of biologically-inspired computational solutions, we have developed detailed neuronal models of insect mushroom bodies and integrated more abstract complete models inspired by the olfactory system of vertebrates in a neural simulator. These models have been integrated in an autonomous robot for odour navigation in real-time. The system is able to locate a chemical source in mixed plume conditions.
- Toxic leakages from industry can be a major environmental health problem. Using a set of vehicles equipped with chemical sensors in the polluted area and proper data fusion algorithms, it is possible to uncover the chemical source. We have developed a Bayesian chemical source localization algorithm using concentration information that is robust against time-varying backgrounds.
- Sepsis is a major cause of death in intensive care units. In an exploratory cooperation with Daniel Navajas' group at IBEC (page 33), we have shown that breath analysis with ion mobility spectrometry can detect sepsis in rats with minimum analysis times and without any sample pre-treatment.
- While immunosensors can be very selective, they still show cross-sensitivities to structurally related compounds. In cooperation with the Applied Molecular Receptor Group at IQAC, led by Prof. M.P. Marco, we have shown that pattern recognition techniques applied to an Immunosensor array can improve the selectivity towards similar anabolic steroids found in doping cases or illegal feeding.
- Wine fraud in Europe can reach 5% in some countries. In conjunction with the University of Córdoba's Department of Analytical Chemistry, we have shown that ion mobility spectrometry together with pattern recognition techniques can be used to identify the Certified Brand of Origin of white wines.

Models of the insect antennal lobe developed in collaboration with Dr. Dominique Martinez, (INRIA).

Clusters of activity in the olfactory bulb in response to odorants recovered by non-negative matrix factorization (original data courtesy of Leon-Johnson Lab, UCI).

Masters students: Federica Calcagno, Ludovico Donegani, Emma Federici, Paloma Fuentes, Aaron Montero, Velia Napoli, Lluís Sala

Technician: Manuel Vinagre

Research on robotics in medicine deals with the close interaction between people and robots. IBEC's Robotics group, together with the associated group of CREB–UPC, designs and develops intelligent robotic systems to assist people with disabilities and medical personnel. This involves acquiring detailed knowledge about the behaviour and intentions of users, not only to develop an interface adapted to both their needs and the requirements of the tasks, but also to facilitate fine tuning of the level of cooperation between the user and the machine, taking into account the user's abilities.

Our main project in rehabilitation is the design and development of robot control strategies for a simultaneous operation of a neurobot and a motor neuroprosthesis. The project intends to advance in the “assist-as-needed” concept; that is, based on the use of biofeedback, an orthotic device (an exoskeleton) is controlled from user's volitional commands, considering also the user's capabilities (fatigue, level of motor disorder, etc) and their dynamic changes. A special effort is dedicated to developing adequate compliant control strategies, which ensure safe interaction during physical contact between human and robot.

In surgical robotics our research is focused on the design of assisted teleoperation strategies, with the goal of reducing stress for surgeons who perform operations requiring highly delicate actions and great precision. Some surgical procedures can be carried out safely and more effectively with robotic assistance, and this technique also improves reliability. The research of the group does not uniquely focus on the research to improve ergonomics, efficiency and safety during a robot assisted intervention, but also on the transfer of this technology for its clinical applicability. At present, the research team is working in an FP7 Coordinated Action, Eurosurge, which aims to study the technical, ethic and legal aspects that limit the commercial expansion of surgical robots.

Networking

Partnerships

ICREA

The Catalan Institution for Research and Advanced Studies (ICREA) is a foundation supported by the Catalan Government. Its aim is to recruit top scientists for the Catalan R&D system to lead new research groups, strengthen existing ones and set up new lines of research. To achieve its objectives, the foundation works closely with Catalan universities and research centres through long-term agreements that allow ICREA researchers to participate in research groups in these centres. In 2011, four of IBEC's 15 group leaders were ICREA research professors.

Fundación Botín

IBEC's collaboration with the Fundación Botín, a Spanish private institution, is in regard to the technology transfer of results obtained by the Nanobioengineering group led by associate director Josep Samitier (page 42).

CRESIB

IBEC and the Centre de Recerca en Salut Internacional de Barcelona (CRESIB) have an official agreement, signed in 2010, in order to facilitate collaboration in certain areas of common interest. This proposed the establishment of a mixed unit of personnel from both institutes aimed at developing diagnostic and therapeutic nanomedicine-based systems to be applied to malaria.

Consequently, Dr. Xavier Fernández-Busquets, senior researcher in IBEC's Nanobioengineering group, is undertaking research into targeted nanovectors for antimalarial drug delivery across the two institutes and with support from both. In 2011 this initiative was favourably reviewed and will continue for another three years.

CIBER-BBN

Founded in 2006, the Biomedical Research Networking Center in Bioengineering, Biomaterials and Nanomedicine (CIBER-BBN) is one of Spain's Biomedical Research Networking Centers (CIBERs). The primary aim of these consortia is to create large multidisciplinary and multi-institutional networks of research centres that will integrate basic and clinical research. CIBER-BBN, which is financed by the Instituto de Salud Carlos III, works in a number of areas including bioengineering, biomedical imaging, biomaterials, tissue engineering and nanomedicine. Research is focused on disease prevention, diagnostics systems and technologies for specific therapies, such as regenerative medicine and nanotherapies. IBEC works closely with CIBER-BBN, playing a role in the organisation and taking part in its research groups to help them carry out their work. The two institutions also share technical research equipment.

CIBER-BBN projects (2010-2011)

- **ES-CELLTHERAPY** Use of human pluripotent stem cells as vehicles for localized delivery of therapy to brain tumors. PI: **Ángel Raya; Josep Planell**
- **NACRE** New Approaches for Cartilage Regeneration. PI: **Ángel Raya**
- **NANOXEN** Use of optical molecular nanoswitches to control nervous functions in *Xenopus tropicalis*. PI: **Fausto Sanz** (under UB); **María García-Parajo**

- **CELL MECHANICS** Understanding mechanotransduction and cell-substrate interaction mechanisms. Applications in cell therapy and tissue engineering. PI: **Josep Samitier; Josep Planell; Daniel Navajas**

While most of IBEC's funds come from the Generalitat de Catalunya, the University of Barcelona and the Technical University of Catalonia, an increasing proportion comes from national and international competitive research funding, ranging from large instruments such as the EU's Framework Programmes to independent or national foundations. Both projects and people are funded, with IBEC proud to be able to claim no fewer than four group leaders with their own support from one of the most prestigious sources, ICREA, in 2011.

Research agreements and MoUs

Groups from the UB and the UPC Associated with IBEC

In 2011, the IBEC continued to collaborate with the University of Barcelona (UB) and the Polytechnic University of Catalonia (UPC) on joint research programmes. Under an agreement signed in 2006, IBEC funds ten PhD scholarships a year, one for each associated group:

- Biomaterials, Biomechanics and Tissue Engineering (UPC)
- Biomedical Signals and Systems Unit (UPC)
- Robotics and Vision Unit (UPC)
- Instrumentation and Bioengineering Unit (UPC)
- Ionizing Radiation Dosimetry Unit (UPC)
- Graphical Computer Science Unit (UPC)
- Bioelectronics Unit (UB)
- Biophysics and Bioengineering Unit (UB)
- Microbiology Unit (UB)
- Surface Science and Nanotechnology Unit (UB)

Memoranda of Understanding

IBEC's MoUs with outside organisations numbered five in 2011, with more in the pipeline.

■ **Fundació Clínic - Hospital Clínic**

IBEC works with both the Fundació Clínic and the Hospital Clínic in Barcelona to promote applied research across all three institutions.

■ **The Bellvitge Institute for Biomedical Research (IDIBELL), Barcelona**

On 6 June 2011, IBEC presented its activities to biomedical researchers and clinicians from IDIBELL to kick off the official collaboration agreement between the two institutes, which was signed in September 2009. The presentation featured talks on IBEC's new Strategic Research Initiatives (SRIs) – the institute's 'flagships' of interdisciplinary research focusing on providing solutions for specific pathologies or bottlenecks and involving several IBEC groups – in nanomedicine, cell engineering and intelligent healthcare.

The next step would be a series of focused workshops alongside two or three groups from IDIBELL who have identified 'collaborative potential' in some of the expertise displayed by their counterparts at IBEC, and vice-versa.

The close interaction of researchers at IBEC and medical staff at IDIBELL will enable clinicians to benefit from the technology being developed at IBEC and allow investigators here to gain access to clinical opinion. With the official kick-off of the activities of this Memorandum

IBEC constantly pursues opportunities to collaborate on a long-term basis with other world-class national or international research institutes with an agreement or Memorandum of Understanding (MoU), with particular emphasis on clinical translation. Such agreements aim to promote exchange of researchers to execute projects, the dissemination of information, sharing of resources and organization of joint activities, and the implementation of cooperative research between them.

of Understanding, IBEC will be able to ensure that its research in the three focused areas of nanomedicine, cell engineering and intelligent healthcare develops in directions that will have the most impact on health and society.

■ **National Institute for Materials Science (NIMS), Japan**

The MoU between the National Institute for Materials Science (NIMS) in Tsukuba, Japan, and IBEC has been in place since July 2009 and focuses on collaborations on the design of biomaterials surfaces and biosensors for cell function, manipulation and analysis.

■ **Institute of Tissue Regeneration Engineering (ITREN), Dankook University, Korea**

Honouring the agreement to exchange researchers in the MoU signed with Korea's Institute of Tissue Regeneration Engineering (ITREN) in 2008, senior researcher Dr. Oscar Castaño from the Bio/Non-Bio Interactions for Regenerative Medicine group spent three months at ITREN in 2011 working on hybrid bioactive nanofibers for bone regeneration with the institute's Bioadvanced Materials group. Reciprocally, ITREN PhD student Jong-Eun Won spent three months with the IBEC group from February to April.

■ **University of Warwick, UK**

In 2011 IBEC played host to visitors from the University of Warwick's Centre for Cognitive and Neural Systems (see page 92), following the signing of a Memorandum of Understanding between the two institutes in 2010.

■ A collaborative research agreement between IBEC and the **Interstaatliche Hochschule für Technik Buchs (NTB)** is planned to be renewed in 2012. Stemming from a long-term informal collaboration between IBEC's Nanobioengineering lab (page 42) and the Switzerland-based institute, the relationship was formalised in 2009 and promotes a cooperative approach to the development of new nanotechnology-based methods for the fabrication of sensor arrays and microfluidic structures for lab-on-chip devices.

■ In October 2011, a delegation of the Innovation department of the **Vall d'Hebron Research Institute (VHIR)** in Barcelona visited IBEC to establish the basis of a cooperation agreement similar to the one signed with other hospitals.

Institutional initiatives and projects

Spanish Nanomedicine Platform

The Spanish Nanomedicine Platform (NanoMed Spain) is a forum managed by IBEC that brings together public research centres, hospitals, companies and government representatives to unite public and private interests in the development of common strategies. NanoMed Spain represents the interests of its stakeholders in the burgeoning and multidisciplinary area of nanomedicine, and is supported by the Spanish Ministry of Science and Innovation (MICINN).

In 2011, the activity of NanoMed Spain was focused on:

- Contributing to define the Spanish position in relation to HORIZON 2020, the continuation of the European Commission's Seventh Framework Programme (FP7), in all aspects related to the application of nanotechnology to healthcare.
- Collaboration with other sectors which can benefit from the application of nanotechnology to healthcare, such as the food and environment industries. Beyond collaboration with other technological platforms representing these sectors, IBEC associate director and coordinator of NanoMed Spain Josep Samitier was appointed the Spanish representative at the European Food Safety Authority (EFSA) Scientific Committee to deliver some practical guidelines for the risk assessment of engineered nanomaterial (ENM) applications in food and feed. This is the first of its kind to give practical guidance for addressing potential risks arising from applications of nanoscience and nanotechnologies in the food and feed chain.
- Presentation of the document "Nanomedicine in Spain 06-10", which provides an overview of the main initiatives, large multidisciplinary projects and internationalization efforts undertaken under NanoMed Spain's advice and leadership.
- Participation in the validation workshop, 'Nanomedicine in Spain: present and future', held at the Center for Industrial Technological Development (CDTI) in Madrid on 1 February 2011. Experts from diverse Working Groups in diagnostics, nanopharmaceuticals and regenerative medicine discussed the conclusions that could be drawn from the mapping of R+D capacities and industry expectations in these areas, and outlined

possible next steps for innovation in nanomedicine in the country. NanoMed Spain is currently working to distill the results into a document to advise policy making and national investors to help the clinical transfer of nanomedicine become a reality.

PRINCIPAL ACTIVITIES of NANOMED SPAIN:

Collaboration with other platforms

NanoMed Spain was the organiser, together with the Spanish Technology Platform for Innovative Medicines and the Platform on Healthcare Technology, of the 4th Annual Conference of Technological Platforms for Biomedical Research, which took place in Madrid on 28 February-1 March 2011. This annual event has become a key date in the nanotechnology calendar and showcases how the field is aiding the development of innovative products in medical technologies and the pharmaceutical industry. It also provides an excellent meeting point for the private and public sectors, as well as policy makers.

Representation of the Spanish nanomedicine community at international level

In October 2011, the annual forum of the European Platform on Nanomedicine (ETPN) was hosted in Barcelona by IBEC in its capacity as manager of NanoMed Spain and coordinator of the Connect-EU Nanobio+Nanomed working group (see opposite). The Spanish Secretary of Innovation and Catalonia's General Secretary of Universities and Research opened the conference, which welcomed speakers and attendees from the nanomedicine community throughout Europe, spanning research, industry, the medical sector and funding bodies. As nanomedicine has been experiencing continued and increased interest, the event focused strongly on raising awareness for translational research and clinical needs, with particular emphasis on discussing strategic opportunities for stakeholders coming from industry, academia and clinics.

NanoMed Spain also participated in EuroNanoForum 2011 in Budapest on 30 May-1 June, at which 1200 attendees learned about recent research breakthroughs and viewed close-to-market nanotechnology developments. Over 70 research centres, industrial leaders such as Bayer, Umicore, Fiat and Nokia, and 15 funding agencies including the European Commission were present at the forum.

In its role as the country's leading research institute in bioengineering and nanomedicine, IBEC manages or is a partner of several national and international initiatives with a range of goals including bringing together entities to network and share resources, providing advice and support, organising events, or acting as a representative, collective voice or expert consultant for stakeholders or funders.

Connect-EU

In 2011 the IBEC-coordinated Connect-EU Nanobio+Nanomed working group, which was set up at the end of 2010, published a 'roadmap' for nanobiotechnology capabilities in Catalonia. The document, 'Connect-EU Nanobio+Nanomed Strategic Research Agenda' was presented on 20 October 2011 at the annual forum of the European Platform on Nanomedicine (ETPN), which followed the 4th IBEC Symposium at the Hospital de Bellvitge on 18-19 October. The document marks the first major step of the working group's first ten months of work, and is the beginning of a series of actions to promote and reinforce Catalan participation in the EU's instruments for research funding such as FP7 and its successor, HORIZON 2020.

As well as providing a plan for this strategic area of knowledge in the region, the publication aims to help define priorities in innovative applications for the pharmaceutical, medtech and environmental industries that can be transformed into European projects.

During 2011, the Connect-EU Nanobio+Nanomed working group developed an agenda of dissemination activities with the aim of establishing itself as a contact with the diverse officers from the research programmes funding nanobio-related activities, such as FP7's NMP, ICT and HEALTH, as well as the Spanish National Contact Points and representatives of the committees working on the annual working programmes. The most important event in this context was the Acte de Presentació dels Grups Connect-EU on 13 July 2011, when all fifteen Connect-EU working groups – which cover areas ranging from aerospace, agribusiness and water to energy, materials and health – were officially presented at the European Commission in Brussels.

KET – Key Enabling Technologies

IBEC's director, Josep A. Planell, is Sherpa of the EC's Key Enabling Technologies High Level Group (HLG) on Nanotechnology. Launched in July 2010, the mission of the HLG is to assess the competitive situation of technologies in the EU, analyse the available public and private R&D capacities for them, and to propose specific policy recommendations for more effective industrial deployment of KETs based on consultations of European stakeholders. The final report will play a vital part in the implementation of the EC's Europe strategy in R+D and innovation, HORIZON 2020.

Strategic alliances

ACER

The Associació Catalana d'Entitats de Recerca (ACER) is an independent association which was established in 2003 to bring together non-profit R&D institutions, as well as helping to define scientific and research priorities and policies in Catalonia. Its ultimate goal is to help consolidate the region as an international leader in scientific and technological research and to optimize the management and implementation of the member centres in the areas they represent, which includes social sciences and humanities, life sciences and health sciences, natural mathematics and technology.

Most of ACER's members have close links with universities and the significant participation of the Generalitat de Catalunya, as well as support from various public and private sources.

Biocat: The BioRegion of Catalonia

Biocat is the organization that coordinates, develops and promotes the biotechnology, biomedicine and medical technology sectors in Catalonia. Its mission is to make the region an international reference in terms of high quality research, competitive networks and an increasingly dynamic knowledge transfer system. IBEC contributes to the BioRegion programme by taking part in the BioRegió Forum, an advisory body actively involved with all the organizations associated with Biocat. IBEC has played an active role in the initiative by creating a medical technology cluster in Catalonia, which is run by Biocat.

BioNanoMed Catalunya

In May 2011, the IBEC-led alliance created to promote nanotechnology applied to healthcare and biotechnology, BioNanoMed Catalunya, was presented to the media at the Museu Colet in Barcelona. BioNanoMed Catalunya brings together 18 research centres, hospitals and companies to share know-how and resources, facilitate new developments in nanomedicine and gain international visibility for the advances in nanotechnology that are emerging in Catalonia.

Along with Biocat, the Catalan Bioregion agency, IBEC has been developing the initiative since 2009. Among the 37 research groups involved in the alliance are IBEC's Bio/Non-bio Interactions for Regenerative Medicine, Cellular Biomechanics, Nanobioengineering, and Nanoprobes and Nanoswitches groups. As the next ten years will be key in transforming the results of bionanomedical research into more effective diagnostic systems and therapies, new tools to improve the environment or more efficient industrial production systems in the biotechnology sector, BioNanoMed Catalunya's challenge is to effectively coordinate strategies and establish cooperative links.

The alliance's new website, www.bionanomedcat.org, was also presented at the press conference in May. It aims to become a benchmark site in Catalan bionanomedicine, featuring qualitative information on the companies and organizations active in the field, documents and news. In addition, the network's first public activities in 2011 included a presentation to the European policy makers and other cluster representatives at the EuroNanoForum 2011 and participation in Washington's BIO Convention in June.

Several organisations exist at a local or national level to consolidate research efforts in particular fields, coordinate and encourage greater visibility for the activities of research centres, or bring together similar entities with a common goal from different regions.

IBEC is a member or partner of the following organisations and initiatives.

Biopol'H

Biopol'H is a biomedical and biotechnology cluster of health care facilities, knowledge-generating institutions, research centres and companies from the life sciences and health sectors, in a physical environment formed by the Bellvitge Institute for Biomedical Research (IDIBELL), the University Hospital of Bellvitge, the Catalan Institute of Oncology (ICO), the Health Sciences Campus of Bellvitge (UB) and the future Biopol Health Science Park. It is located within the municipality of L'Hospitalet de Llobregat.

A day-long workshop, Nanomedicine for Healthy Ageing, was organised jointly by Biopol'H and IBEC on 19 October 2011. Following on from the 4th IBEC Symposium on Bioengineering and Nanomedicine (page 93), the workshop welcomed experts including Laura Ballerini of the University of Trieste, Scott Parazynski of The Methodist Hospital Research Institute in Houston and Yuri Volkov of Trinity College Dublin. They and the other top speakers, who included Dr. Jaume Campdelacreu from IDIBELL representing the clinical arm of the cluster, led discussions on the potential of nanotechnologies for improved diagnosis and treatments for conditions associated with ageing.

European Technological Platform on Nanomedicine (ETPN)

A voting member of ETPN since 2008, IBEC has contributed as an invited expert body, through its director and the Institutional Projects Unit, to 'Roadmaps for Nanomedicine Towards 2020'. This key document in the area of nanomedicine was drawn up to advise the European Commission on future R&D investment needed to ensure successful translation of the results of research into the related sectors of medical and pharmaceutical technologies.

In 2011 IBEC, in its capacity as manager of NanoMed Spain and coordinator of the Connect-EU Nanobio+Nanomed working group, hosted the annual forum of the ETPN in Barcelona.

HUBc

The Health UB Campus (HUBc) project, led by the University of Barcelona, brings together about 30 training institutions, research and knowledge transfer in health sciences, mainly around the campus of the Medical and Hospital San Juan de Dios, the campus Health Sciences with the University Hospital of Bellvitge, ICO, IDIBELL, Biopol'H, and Barcelona Innovation Zone. On 21 October 2010, HUBc achieved recognition by the Ministries of Education and Science and Innovation as a campus of international excellence.

Its main strength is the high degree of specialization in the field of health, provide attraction of talents and capabilities will add the cities of Barcelona and L'Hospitalet de Llobregat to coordinate, stimulate and promote biomedicine, biotechnology and medical technologies. It offers support to several of IBEC's activities such as the IBEC Symposium on Bioengineering and Nanomedicine and the IBEC-hosted forum of the European Platform on Nanomedicine (ETPN) in 2011.

Interbio

Sponsored by the EC, Interbio is an interregional cooperation programme which aims at fostering transnational cooperation, technology transfer and innovation in the fields of biotechnologies and life sciences in south-west Europe. Interbio brings together research centres, technology platforms and companies from the Barcelona, Bordeaux, Lisbon, Toulouse and Valencia regions.

Nanoaracat

Nanoaracat is a protocol that establishes a framework for collaboration between the regional governments of Aragon and Catalonia to foment and coordinate R&D projects in nanoscience and nanotechnology. IBEC is one of 17 institutions involved in this initiative and is a member of the scientific and monitoring committees.

IBEC Seminars and PhD Discussions

IBEC Seminars

Throughout the year, a number of international experts, scientists who work with our research teams on certain projects and some of the IBEC group leaders are invited to give lectures as part of the IBEC Seminars programme. The aim of these events is to provide an overview of the state-of-the-art research in various fields and to give the audience the opportunity to discuss recent developments with the guest speakers.

■ 14 January

Maria V. Sanchez-Vives, Institut d'Investigacions Biomèdiques August Pi i Sunyer (IDIBAPS), Barcelona
Cerebral cortex network dynamics

■ 4 February

Dr. Daniel Riveline, Laboratory of Cell Physics, Institut de Science et d'Ingénierie Supramoléculaires (ISIS) and Institut de Génétique et de Biologie Moléculaire et Cellulaire (IGBMC), Strasbourg, France
Two examples of cell physics phenomena: cell adhesion and cell division

■ 18 February

Manuel Fuentes, Cancer Research Center, Department of Medicine, University of Salamanca-CSIC
Self-assembling Protein Microarrays and Surface Plasmon Resonance Imaging to study high-throughput protein interactions of p53 and Mdm2

■ 4 March

The taste system beyond taste: novel paths to explain hunger and satiety in mammals

PhD Discussions

These seminars are intended to encourage the participation of PhD students, providing a forum where they can present the results of their research and discuss it with fellow students and researchers. Throughout 2011, eleven PhD students participated in these sessions. Additionally, in order to help the students in their career development and provide them with additional skills, three invited speakers gave lectures on various topics.

Complementary skills sessions (invited speakers)

■ 28 January

Meetings and outreach activities

Complementary skills training

Throughout the year, IBEC's staff researchers have the chance to supplement their professional expertise at a range of complementary skills courses organised by the Human Resources department.

In 2011, training was focused on efficiency in communication in three main areas: scientific writing, oral presentations, and communicating with colleagues.

- Throughout the year
- IBEC
- 75 people approximately

Connect-EU Nanobio+Nanomed Working Group

A meeting of the Connect-EU Nanobio+Nanomed Working Group, which is coordinated by IBEC (see page 83). During the meeting, the group discussed the first steps towards its aim to provide an expert opinion on the 'hot' topics and the local strengths in the field for ACC10, the agency set up by the government to make Catalan enterprise more globally competitive.

- 27 January
- IBEC
- 23 participants

Jornada de Nanomedicina en España: Presente y Futuro

A one-day workshop, 'Nanomedicine in Spain: present and future' was held at the Center for Industrial Technological Development (CDTI) in Madrid. At the meeting IBEC presented a 'who's who' of Spain's major players in nanomedicine and a record of this new field's most notable

achievements, "Nanomedicine in Spain 06-10", which had been coordinated by the institute in its capacity of leader of the Spanish Nanomedicine Platform (see page 82).

- 1 February
- CDTI, Madrid
- 92 participants

CTP project meeting

A meeting of the transnational project 'Desenvolupament d'eines innovadores per a la Ocratoxina A', coordinated by postdoc Beatriz Prieto of the Nanobioengineering group and funded by the Comunitat de Treball dels Pirineus (CTP).

- 2 February
- IBEC
- 15 participants

EscoLab visit

EscoLab is an initiative of Barcelona City Council's Commission for the Promotion of Scientific Culture. It introduces high school and VET students to the city's research laboratories, with the aim to increase scientific vocation among students.

After a presentation from IBEC Director Josep Planell about the institute and its research areas, the 23 14-15 year olds and their teachers visited the Bio/non-bio Interactions for Regenerative Medicine, Biomechanics and Mechanobiology and Control of Stem Cell Potency groups, where researchers gave them some insights into computational models, cell differentiation, zebrafish as a model organism, and electrospinning.

- 23 February
- IBEC
- 23 participants

Left-right: Meeting of the Connect-EU working group; ESCOLAB; MySpine meeting

BOND project meeting

The third technical meeting of the project 'Bioelectronic Olfactory Neuron Device (BOND)', which is funded by the European Commission under FP7 and coordinated by associate director Josep Samitier, with group leader Gabriel Gomila as technical manager. Seven other partners from France, Italy, Ireland and the UK are also involved.

- 7 March
- IBEC
- 20 participants

NeuroChem project meeting

Meeting of the project 'Biologically Inspired Computation for Chemical Sensing (NeuroChem)', which was funded by the European Commission under FP7 and coordinated by Artificial Olfaction group leader Santiago Marco.

- 9-11 March
- Hotel Senator, Barcelona
- 75 participants

MySpine project meeting

The kick-off meeting of the project 'Functional prognosis simulation of patient-specific spinal treatment (MySpine)', which is funded by the European Commission under FP7 and coordinated by Biomechanics and Mechanobiology group leader Damien Lacroix.

- 22 March
- IBEC
- 20 participants

Recerca en acció

An education fair organised by the Catalan Foundation for Research and Innovation to demonstrate the results of scientific and technological research being carried out by universities, research centres, businesses and other organizations, and to promote science and technology careers among young people.

In 2012 IBEC shared a stand with other Catalan institutes in an initiative organised by ACER (see page 84).

- 26 March
- Fira de Barcelona
- 70000 visitors

School visit

A visit to IBEC of 24 students from Escuela IES Ramón Cid.

- 31 March
- IBEC
- 24 participants

Fira Recerca en Directe

The 'Live Research' fair is organized by the Parc Científic de Barcelona (PCB) with the support of the Obra Social Caixa Catalunya bank. It aims to improve understanding and awareness of science by presenting Barcelona research to the general public, with researchers manning the stands to demonstrate and explain their methods and goals in an accessible way.

In 2011 scientists from IBEC's Control of Stem Cell Potency group attended the fair, where they introduced visitors to the zebrafish as a model organism. Under a stereomicroscope visitors were shown embryos at different stages of development, including transgenic embryos displaying fluorescent hearts.

- 5-7 April
- La Pedrera, Barcelona
- 1200 visitors

Student visit

A visit to IBEC of nine Genetic Engineering masters students from the UPC.

- 13 April
- IBEC
- 14 participants

Fira d'Empreses

This careers fair, organized by the University of Barcelona's physics and chemistry faculties, helps undergraduate students of these subjects to find out more about potential employers or furthering their studies, as well as improving the university's relations with the business sector.

IBEC attended the fair to offer university leavers advice and information about continuing their career at the institute as masters or PhD students.

- 5 May
- University of Barcelona
- 250 visitors

Connect-EU Nanobio+Nanomed Working Group

A further meeting of the Connect-EU Nanobio+Nanomed Working Group.

- 26 June
- IBEC
- 20 participants

E2C3 Youth and Science Programme

Three high-school students were hosted in IBEC labs for several weeks in July as part of Catalunya Caixa's E2C3 Youth and Science Programme, which exposes talented and motivated young students to 'real' scientific work to encourage more of them to embark on a scientific career. Laia Gil, Joaquim Viñes and Laia Gili joined researchers Melba Navarro and Cécile Perrault for some hands-on

experience in the contribution of microtubules to cellular forces and the characterisation of biodegradable materials for bone regeneration.

- 2-4 weeks in July
- IBEC
- 3 participants

IBEC Makes a Splash

IBEC Makes a Splash day on 28 July heralded the start of the summer break and gave staff and researchers alike the chance to get together to play sport, take some exercise, learn a new skill or simply lounge by the pool.

The event, which ended with a buffet and toasts, was the ideal opportunity for IBEC to celebrate its great achievement of getting to the first round of the MICINN's Severo Ochoa selection.

- 28 July
- University of Barcelona's sports ground, Esports UB
- 80 participants

Warwick University visit

Following the signing of a Memorandum of Understanding between the two institutes last year (see page 81), IBEC played host to visitors from the University of Warwick in September. Nigel Stocks, Christopher James, Jianfeng Feng, Pat Unwin and Pam Thomas from the UK-based institution took part in some high-level meetings with IBEC's directors and some lab tours, as well as presenting their science to a gathering of IBEC researchers.

From the IBEC side, Gabriel Gomila, Pau Gorostiza, Agustin Gutiérrez, Josep Samitier and Raimon Jané presented their work, and the event proved a ideal opportunity to identify future collaborations and discuss the exchange of knowledge and personnel.

- 22-23 September
- IBEC

4th IBEC Symposium on Bioengineering and Nanomedicine/Nanomedicine for Healthy Ageing

The IBEC Symposium is a forum, open to the whole scientific community, where internationally renowned experts present their recent results in bioengineering and nanomedicine. It also offers a platform for the institute's young researchers to present their work and get feedback from more experienced scientists.

Over 250 people attended the 4th IBEC Symposium on Bioengineering and Nanomedicine, with more than a third coming from outside the institute. A total of 71 young researchers presented posters, and 27 of them also gave oral presentations of their work. The second day of the symposium was co-organised by Biopol'H (see page 85) and was devoted to the topic of Nanomedicine for Healthy Ageing.

- 18-19 October
- Hospital de Bellvitge
- 250 people
- 71 posters

ETP Nanomedicine General Assembly and Annual Forum

The European Technological Platform on Nanomedicine (ETPN; see page 85) General Assembly and Annual Forum on 19-21 October, which IBEC also organised, followed on from the IBEC Symposium at the Hospital de Bellvitge.

- 19-21 October
- Hospital de Bellvitge
- 100 participants

PathoGenomics project meeting

A meeting of the project 'Identification of hot spots of divergence and rapidly changing genes within Shiga toxin-producing *E. coli*', which is funded by the European Commission's ERA-NET PathoGenoMics initiative. Senior researcher Eduard Torrents of the Microbial Biotechnology and Host-pathogen Interaction group is the IBEC partner.

- 9 November

Communications

www.ibeccbarcelona.eu

The IBEC website, www.ibeccbarcelona.eu, underwent a design and content overhaul in 2010-2011. Launched in May 2011, the new-look site has a clean new design with a dynamic homepage and several new sections. The homepage displays the latest news, events, press releases and scientific publications, and the jobs section is now more visible and intuitive.

New sections include Technology Transfer and Training, and all IBEC news items, media coverage and press releases are available to refer to in the easy-to-use chronological archive. A Documents and Downloads page offers all IBEC publications including the InsideIBEC newsletter, Annual Reports, the PhD brochure and associated documents to view online or as downloads.

The research group pages were also extensively overhauled and are now divided into six tabbed sections: group description, members (including an option to display former members), publications, projects and collaborations, protocols and equipment, and news. With this format, information is easier to find and the amount of detail that may be included is unlimited.

Some sections of the new website are still under development. It is intended that each area of Support Services will have a dedicated page to explain their activities and the services they offer to IBEC's researchers; a "Want to visit IBEC?" page will be added for schools and other potential visitors; and the Templates page will provide logos and branded IBEC templates such as presentation slides and headed paper. In addition, an online 'press area' of expert opinions, images and videos in bionengineering and nanomedicine will be established.

IBEC Facebook page

In 2011 IBEC opened its own Facebook page, which by the end of the year was running successfully with over 180 'friends'. The Facebook page is intended to provide a forum for more community and social news, and also to act as a tool to enhance visibility among potential new young recruits.

Attract Talent Scheme

In autumn IBEC produced a PhD brochure and poster as part of a new campaign to attract talented young researchers to the institute. The brochure includes information about the PhD system in Spain, the benefits of doing a PhD at IBEC, which study programmes are open to researchers, and how to apply, as well as testimonials from past students.

The brochure and accompanying publicity materials will be disseminated at conferences, meetings, fairs and to relevant institutions with undergraduate and masters students, and a dedicated PhD webpage has been created.

Merge of events and communications units

At the end of 2011 IBEC's events and communications departments merged to become the Communications and Outreach Department. As well as continuing to perform the existing tasks in both areas and some Human Resources services, the new unit will extend its efforts into other fields, particularly improving IBEC's record of participation in outreach activities, internal communication and encouraging a community spirit, exploring new technologies, and media relations.

Media coverage 2011

■ January

Ràdio 4 16/01/2011

An interview with Biomechanics and mechanobiology group leader Damien Lacroix about the new EU-project he coordinates, MySpine, was broadcast on Ràdio 4's L'Observatori programme.

E-News Biocat 20/01/2011

"Nanomedicine: Where Nanotechnology, biotechnology and the health sciences come together"
IBEC associate director Josep Samitier was a contributor to the January edition of Biocat's e-newsletter.

■ February

RecerCaixa 13/02/2011

Group leader Pau Gorostiza featured in a short video produced by funders RecerCaixa about his project 'Development of light-modulated ligands for remote, non-invasive regulation of neuropathic pain'.

El 9 Nou 21/02/2011

"Cal connectar les mans robotiques amb el nervi perquè rebin ordres"
Robotics group leader Alicia Casals appeared in Catalan local paper El 9 Nou, which covers the Osona/Ripollès and Vallès Oriental areas.

■ March

Research*EU 01/03/2011

"Protecting nanotechnology research results"
IBEC's FP7 project on technology transfer, Nano2Market, was featured in the Commission's Research*EU magazine supplement (Vol. 30, December 2010/January 2011).

El Mundo 02/03/2011

"Estamos hechos de vidrio"
In a study published in PNAS, group leader Xavier Trepas reveals that migrating cells in our bodies behave in a remarkably similar way to glass when it is heated and cooled. Spanish national newspaper El Mundo covered this story in March.

■ April

Nature Jobs 06/04/2011

"Keeping Catalonia's research revolution on track"
IBEC featured in a Nature Jobs article, Spotlight on Catalonia, which asked how the region is coping with Spain's financial crisis, having fostered a successful research hub in a relatively short time.

El Periódico 11/04/2011

"Sin un andamio de apoyo"
IBEC associate director Josep Samitier was an expert opinion quoted in El Periódico regarding a story about a Japanese study that succeeded in growing an embryonic eye from the stem cells of mice.

El País 12/04/2011

"Imaginenano 2011: Primer evento global en España de nanociencia y nanotecnología"
Coverage in El País of Imaginenano, one of the largest European events in nanoscience and nanotechnology which took place on 11-14 April at Bilbao Exhibition Centre, in which IBEC took part.

ENT Today 18/04/2011

"System Automatically Monitors Apnea-Hypopnea Index"
Research by the Biomedical Signal Processing and Interpretation group featured in the section 'Literature Review: A roundup of the most important recent studies' of ENT Today magazine.

Diario Medico 26/04/2011

"La nanomedicina, clave del diagnóstico precoz"
An article entitled "Nanomedicine, the key to early diagnosis" including an interview with IBEC associate director Josep Samitier appeared in Diario Medico.

■ May

Interbio website 09/05/11

“Feedback on Interbio cross-border research projects”

Postdoc researcher in the Nanobioengineering group Antoni Homs was asked to give some feedback to be published on the website of the collaborative project Interbio.

La Vanguardia 13/05/2011

“Descubierta una nueva célula en el cuerpo humano”
IBEC group leader Ángel Raya was quoted in an article in La Vanguardia about recent research from Harvard that has discovered a cell type previously unknown in the human body.

TV3 16/05/11

The official press launch of BioNanoMed Catalunya, the IBEC-led platform to promote synergies between groups, universities, hospitals and companies doing research in nanotechnology applied to health and biotechnology (page 84), featured in the lunchtime news on TV3 on 13 May.

Ara 30/05/11

“Volem que el nostre coneixement es traslladi al sector de la salut”

In the Catalan newspaper Ara, IBEC associate director Josep Samitier was interviewed for a full-page feature. In it, he tells journalist Joan García about the history and goals of IBEC, its successes and the challenges it faces.

■ June

La 2 02/06/11

Angel Raya and his Control of Stem Cell Potency Group appeared in an edition of the tres14 program on national TV channel La 2, which was devoted to the subject of stem cells.

El Global 15/06/11

“La alianza ‘BioNanoMed Catalunya’ une a 18 empresas e instituciones”

In its June edition, El Global, the most prominent journal on the pharmaceutical sector in Spain, featured a news item on the IBEC-led alliance BioNanoMed Catalunya.

SEBBM 16/06/11

“Nanomedicina: nanotecnologías aplicadas a la salud”

An article by IBEC associate director Josep Samitier, ‘Nanomedicina: nanotecnologías aplicadas a la salud’ appeared in SEBBM, a periodical published by the Sociedad Española de Bioquímica y Biología Molecular.

Destacamus 16/06/11

“Xavier Trepà, investigador principal del Laboratori de Dinàmica Cel·lular i del Teixit de l’IBEC”

IBEC group leader Xavier Trepà was the subject of an edition of Destacamus, a bimonthly magazine published by Biopol’H which profiles researchers.

■ July

La Vanguardia 04/07/11

“Mejorar la vida y potenciar empresas”

An article about BioNanoMed Cat appeared in La Vanguardia’s Dinero supplement on 19 June, in which Josep Samitier and the director general of Biocat, Montserrat Vendrell, explain the aim of the IBEC-led alliance.

Recercat 07/07/11

“Líders en recerca: Pau Gorostiza, aportant llum a l’activitat cel·lular”

Nanoprobosc and Nanoswitches group leader and ICREA professor Pau Gorostiza is featured in an interview in Recercat, the online newsletter of the Commission for Universities and Research of the Ministry of Economy and Knowledge.

Teraflo 15/07/11

“L’estudi de l’efecte biomecànic sobre el cos humà”

The Biomechanics and Mechanobiology group’s work and Damien Lacroix’s recent ERC grant was the subject of an article in July’s Teraflo, the magazine of the Centre de Serveis Científics i Acadèmics de Catalunya (CESCA).

FET 22/07/11

“NEUROchem’s new avenues to chemical sensing”

The Neurochem project, Biologically inspired computation for chemical sensing, was featured in the July edition of the FET (Future and Emerging Technologies in Europe) newsletter which is published by the European Commission.

La 1 22/07/11

The MICINN meeting in Madrid, which invited the directors of the Severo Ochoa shortlist, was featured on the lunchtime news bulletin Telediario on national TV channel La 1 and appeared in several newspapers.

El Periódico 25/07/11

“Un robot tiene que portarse de forma agradable”

PhD student Xavier Giralt was interviewed for the ‘Gente corriente’ section on the back page of El Periódico.

Diario Medico 26/07/11

“Identifican una interacción molecular esencial en el desarrollo de la epilepsia”

The Molecular and Cellular Neurotechnology group's paper on the development of epilepsy made the news in Diario Medico, Spain's leading newspaper for health professionals.

■ August

BBC 05/08/11

“Back pain and disc health ‘linked’ to lack of nutrients”

The Biomechanics and Mechanobiology group's paper in PLoS Computational Biology made the BBC news. Andrea Malandrino, Jérôme Noailly and group leader Damien Lacroix's paper, ‘The effect of sustained compression on oxygen metabolic transport in the intervertebral disc decreases with degenerative changes’ describes results that could help to predict the onset of spinal disc degeneration.

youris.com 29.08.11

“From wood to bone”

Elisabeth Engel, Senior researcher in the Bio/non-bio interactions for regenerative medicine group, was interviewed for the European Research Media Center's website, youris.com, for her expert response to some research into bone regeneration conducted by researchers in Italy.

■ November

Catalunya Ràdio 02/11/11

Robotics group leader Alicia Casals was interviewed on the Catalunya Ràdio programme “El Café de la República” in November. This popular evening programme discusses the news of the day and the ‘hot topics’ of the moment.

TVE2 10/11/11

On 23 October, IBEC's Robotics lab was featured in an episode of ‘Emprendedores e innovadores’ on TVE2, when visiting masters student Paloma Fuentes gave viewers a tour of the robot kitchen with the help of IBEC PhD student Manuel Vinagre.

■ December

The Discovery Channel 07/12/11

The Discovery Channel's Daily Planet programme on 28 November featured a report about the LOTUS project, of which IBEC group leader Santiago Marco is a partner.

TV3 13/12/11

IBEC's research was featured on the TV3 news in an item filmed to highlight the ‘La Marató de TV3’ telethon.

youris.com 14/12/11

“A patient-specific predictive platform to treat back pathologies”

The European Research Media Center's website, youris.com, featured an article about the MySpine project, which is coordinated by IBEC group leader Damien Lacroix.
